Preferred Option WSJ-5b would require a partial closure of the intersection at Fauntleroy Way Southwest and Southwest Avalon Way. Both of these streets are part of the City's Over-Legal Network; Fauntleroy Way Southwest is a Major Truck Street and Southwest Avalon Way is a Minor Truck Street. It would affect one general load zone on 41st Avenue Southwest.

There is no rail network in this segment.

Other Build Alternatives (WSJ-1, WSJ-2, WSJ-3a, WSJ-3b, WSJ-4, WSJ-5a, and WSJ-6)

Alternative WSJ-1 and Alternative WSJ-2 would require a full closure on Fauntleroy Way Southwest on nights and weekends. Alternative WSJ-1 would affect four general load zones along Fauntleroy Way Southwest, 38th Avenue Southwest, and 39th Avenue Southwest. Alternative WSJ-2 would affect three truck-only load zones on Fauntleroy Way Southwest, and three general load zones on 38th Avenue Southwest, Fauntleroy Way Southwest, and Southwest Genesee Street.

Alternative WSJ-3a and Option WSJ-3b would require a partial closure of Fauntleroy Way Southwest. Alternative WSJ-3a and Option WSJ-3b would affect two general load zones.

Alternative WSJ-4 would require a full closure on Fauntleroy Way Southwest on nights and weekends. Alternative WSJ-5a would require partial closure of Fauntleroy Way Southwest. Alternative WSJ-4 would not remove any load zones, and Alternative WSJ-5a would affect one general load zone on 41st Avenue Southwest. WSJ-6 would not affect any truck streets but would affect one general load zone on 41st Avenue Southwest.

9.4 Potential Mitigation Measures

9.4.1 Long-term Impacts

Freight traffic could be affected by the mitigation options being considered on 4th Avenue South to address the impact to transit of the SODO Busway closure. Potential improvement options for the busway closure include modifying 4th Avenue South with bus queue jumps at key intersections, business access and transit lanes, and/or a freight and bus lane that could be shared by buses and trucks. The first two transit improvement options could increase delays to truck traffic on 4th Avenue South, and the third option could reduce delays for truck traffic on 4th Avenue South. Therefore, Sound Transit and the City of Seattle may choose to mitigate the effect to freight travel times by selecting freight and bus lanes as the improvement on 4th Avenue South.

As part of the parking mitigation, Sound Transit would coordinate with the Seattle Department of Transportation to manage curb use in the station vicinities. This would include locating commercial vehicle and truck-only load zones to serve business needs. For more information, see Section 5.4, Potential Mitigation Measures, in Chapter 5.

9.4.2 Construction Impacts

Prior to construction activities that fully or partially close a Major or Minor Truck Street, Sound Transit would work with the City of Seattle to accommodate truck turning maneuvers or to identify detour routes suitable for trucks. Construction activities that affect the City of Seattle's Over-Legal Network, including Southwest Avalon Way and Fauntleroy Way Southwest, would be coordinated with the City of Seattle to identify construction management measures to maintain an envelope to accommodate oversized trucks during construction or to identify suitable alternative routes that would be defined prior to freight movements as part of the City's over-legal permit process.

Sound Transit would coordinate with the BNSF Railway and Union Pacific Railroad prior to construction over rail tracks or ground improvements for guideway columns close to the rail tracks. To the extent feasible, construction activity would adhere to schedule and minimum clearance requirements as agreed to by Sound Transit and BNSF Railway.

Sound Transit would work with the Port of Seattle and Northwest Seaport Alliance to identify construction management measures to maintain adequate port terminal access and operations along its primary drayage routes between the marine and rail terminals. This could include identifying alternative routes for trucks if construction closures affect access or drayage routes along South Spokane Street and other streets that connect the Port terminals to local railyards. In addition, for Alternative DUW-2, measures could include ensuring adequate terminal driveway widths and restricting some construction activities to times of day when the terminals have low or no gate activity. At a broader level, Sound Transit would coordinate with the Port of Seattle and Northwest Seaport Alliance on the construction schedule and sequencing to minimize major construction work on key freight corridors at the same time.

For locations where truck-only load zones, commercial load zones, or general load zones would be eliminated but the businesses that rely on them remain, Sound Transit would coordinate with the City of Seattle to relocate these commercial load zones. For Alternative DUW-2, Sound Transit would work with the Port of Seattle to provide temporary truck parking to replace parking affected by construction activities on Terminal 25.

This page is intentionally left blank.

10 INDIRECT AND SECONDARY IMPACTS

This chapter presents the indirect and secondary transportation impacts from the West Seattle Link Extension Project (the project), which are those that occur later in time or are farther removed in distance during project operation and construction. Any additional mitigation measures beyond those described in previous chapters are also discussed.

10.1 Regional Travel

The completion of the West Seattle Link Extension would provide reliable light rail service between West Seattle and the region's major urban centers, including Downtown Seattle. Light rail service could help facilitate further increases in residential and employment uses around the stations beyond what is assumed for the Final EIS. This could lead to changes in regional and local travel patterns as trips to and from these areas increase for all travel modes, affecting transit, local and regional traffic volumes, parking demand, and non-motorized users.

10.2 Transit Service and Operations

Beyond the future conceptual bus service plan assumed for each Build Alternative, other changes in transit service within the West Seattle Link Extension corridor that are not yet planned or anticipated in response to the project could also result in shifts in ridership. For instance, Metro could redeploy or reinvest in bus service that would be replaced by light rail service above what has been assumed in the West Seattle Link Extension Final EIS.

Investments in high-capacity transit service can attract higher-density residential and commercial land uses around stations; this is known as transit-oriented development. The population and employment projections used in Sound Transit's ridership forecasting model (Puget Sound Regional Council's 2014 Land Use Targets) forecast substantial population and employment growth around project stations. Because the ridership model already accounts for this potential transit-oriented development, ridership is not expected to exceed the forecasts presented in the Final EIS. Passenger load forecasts (see Section 3.3.2.1, Long-term Impacts, in Chapter 3, Transit) indicate sufficient capacity on the project and other routes in the corridor, so overcrowding is unlikely.

10.3 Arterial and Local Street Operations

Increased automobile and bus trips to and from the station areas could result from potential increases in land use development around the light rail stations along the corridor. The increase in traffic could cause additional impacts on the arterials and local streets. Shifts among the automobile, transit, bicycle, and pedestrian modes could also result from increased development along the project corridor. For example, depending on how development is planned and permitted, there could be additional bicycle and pedestrian activity near the station areas.

10.4 Parking

Increase in parking demand around station areas along the project corridor might result from the potential increase in land use development surrounding these areas. The demand for parking more than 0.25 mile from the stations could increase because riders could park along feeder bus routes and travel to the station by bus. Hide-and-ride impacts are not anticipated in station areas, as Sound Transit would work with the City of Seattle to implement curb use management where it does not already exist.

10.5 Non-motorized Facilities

Additional pedestrian and bicycle trips to the station could result from potential increases in higher-density residential and commercial developments. Likewise, light rail ridership at the affected station could potentially increase. These trips may travel along streets that lack sufficient facilities or Americans with Disabilities Act accessibility. However, that could encourage local jurisdictions to implement improvements to these facilities as increased usage becomes evident. The non-motorized analysis (see Chapter 6, Non-motorized Facilities) indicates that the surrounding sidewalks, crosswalks, and corners have ample capacity under future conditions.

10.6 Safety

The potential for increases in residential and employment uses around the light rail stations could lead to an increase in non-motorized activity and further conflicts between all travel modes (i.e., automobile, transit, and non-motorized).

10.7 Freight Mobility and Access

Increased automobile and bus trips to and from the station areas could result from potential increases in land use development around the light rail stations along the project corridor. The increase in traffic could cause additional impacts on the arterials and local street operations near stations, which could affect freight mobility and access on local roadways. Any impacts on freight would be similar to those for automobiles.

10.8 Navigation

No indirect effects to navigation are anticipated. See Section 4.3, Economics, of the Final EIS for discussion of potential indirect effects to maritime businesses.

11 CUMULATIVE IMPACTS

This chapter describes how the cumulative long-term incremental transportation effects of the West Seattle Link Extension Project (the project), in conjunction with past, present, and reasonably foreseeable future actions, are accounted for in the transportation analysis. Cumulative impacts include both direct and indirect impacts resulting from governmental and private actions. Assumed background projects have been reflected in the analyses discussed in previous chapters. Cumulative short-term construction transportation impacts are also presented.

11.1 Impacts during Operation

The analysis of future traffic and transit impacts in this technical report is a cumulative analysis based on the results of traffic modeling and ridership modeling that incorporate past, funded, and approved future actions, as well as projected growth that would result from development in the region. Other reasonably foreseeable transit and development projects could affect transit ridership and travel patterns within the study area, including traffic operations near new stations. This could include possible transit-oriented development in station areas, which would likely increase the numbers of people walking or biking to stations.

As the West Seattle Link Extension becomes operational, its contribution to cumulative impacts on transportation would be beneficial in several ways. The project would contribute travel efficiencies in addition to those provided by the other reasonably foreseeable future transportation improvement projects listed in Appendix A, Future Transportation Project List, of Attachment N.1A, Transportation Technical Analysis Methodology Report. It would shift trips from personal auto to transit, reducing the number of vehicle miles traveled and vehicle hours of delay along the corridor compared to the No Build Alternative. Fewer vehicle miles and hours could improve general traffic conditions, including freight mobility, within the study area. In the SODO Segment, the South Lander Street Overpass that would be constructed as part of the project would eliminate a railroad crossing on South Lander Street between 6th Avenue South and 4th Avenue South, reducing delay.

The project, in combination with other reasonably foreseeable future transit projects, is not expected to have a cumulative impact on parking throughout the study area. The project would either remove or convert some street parking to bus (or other transit) loading zones in the immediate vicinity of the stations. Sound Transit would work with the Seattle Department of Transportation to consider appropriate on-street parking measures within a 0.25-mile radius of each station to discourage hide-and-ride activity and encourage parking availability for residents and businesses in the area.

While other transportation projects could also remove street parking to implement their improvements (for example, a City of Seattle project that changes allocation of the right-of-way), these changes would be consistent with City goals and policies related to curb space management. With the project creating a more connected and accessible regional transit system, especially in the commercial and residential areas along the project corridor, transit ridership would increase and potentially reduce the need for parking within the study area. The City of Seattle could adjust curb space use in the project corridor for reasons unrelated to the project, such as policy, adjacent land uses, transportation improvement project needs, transit service availability, and non-motorized network improvements (for example, the Georgetown to Downtown Safety Project).

This Final EIS assumes completion of the Sound Transit 3 program of regional transit improvements by 2042; Sound Transit's Long-Range Vision (Sound Transit 2014) contains additional rail projects beyond the Sound Transit 3 program that may eventually be implemented. Similarly, the Final EIS assumes that a modified version of King County Metro Transit (Metro) Metro Connects (2021) long-range vision is in place by 2042. These improvements are accounted for in the impacts analysis for this project. If regional transit service is expanded beyond these assumptions, it could attract additional ridership to project stations in the project corridor, thereby increasing vehicle and pedestrian activity around stations. Future unfunded projects or local growth could add more pedestrian and bicycle trips to the street network surrounding the light rail stations and improve non-motorized facilities within the study area.

The City of Seattle is in the process of delivering several safety projects as part of Vision Zero, which is Seattle's plan to eliminate traffic deaths and serious injuries on city streets by 2030, and additional projects may be implemented in the future. These include the Highland Park Way Safety Project and Georgetown to Downtown Safety Project, which will be completed in 2024. In addition, protected bike lanes are planned for several areas near the project corridor. Other development would not likely affect safety in the study area. These projects, together with the West Seattle Link Extension, would lead to an overall improvement in safety.

11.2 Impacts during Construction

Other transportation projects in the study area could have construction periods that overlap with civil construction of the project and, if they include road closures, could extend or intensify the disruption to regular travel patterns in the affected areas. Cumulative traffic-related construction impacts could include longer durations of detours for all modes, increased travel delay and congestion, and increased traffic on detour routes.

In bored-tunnel areas, the project would not affect traffic flow outside of station, station shaft, and portal locations. WSDOT, the City of Seattle, Metro, the Port of Seattle, Northwest Seaport Alliance, and Sound Transit have been coordinating and would continue to coordinate on the construction schedules for transportation projects to avoid major construction work on overlapping corridors at the same time. The proposed project, in combination with the proposed Ballard Link Extension, could include building roadway overpasses at South Lander Street and South Holgate Street, two of the few major east-west streets in SODO that cross the light rail and BNSF Railway tracks. Preferred Option SODO-1c, Alternative SODO-1a, and Option SODO-1b would include construction of one roadway overpass at South Lander Street as part of the West Seattle Link Extension. The proposed Ballard Link Extension would include construction of one roadway overpass at South Holgate Street and, depending on the alternative selected for the south end of the Ballard Link Extension, partial or full closures of Major Truck Streets in the area, including 4th Avenue South, Seattle Boulevard South, and 6th Avenue South. Overlapping traffic-related construction impacts in the SODO Segment would be minimized due to the construction schedules of the West Seattle Link Extension and the Ballard Link Extension. However, the construction schedules may be consecutive or separated by a short period of time, resulting in a cumulative impact by extending the duration of construction closures in the area. Access for all types of vehicles and non-motorized access would be maintained on one roadway while the other is under construction. South Lander Street and South Holgate Street would not be closed for construction at the same time.

Although Alternative SODO-2 would not permanently close the SODO Busway as would occur under the other project alternatives, it would close the SODO Busway for 5 years, followed by a similar closure of 5 years to construct the Ballard Link Extension. This would result in a cumulative 10-year closure of that facility and extending the duration of bus route detours to 4th Avenue South.

The proposed project, in combination with the proposed Ballard Link Extension, could include disruptions to the Link light rail system while the light rail extensions are being integrated into the existing system. The schedules of construction activities that could affect Link light rail service are unknown at this time, but they may occur in similar timeframes, leading to longer periods of service disruptions for light rail riders.

1 INTRODUCTION

1.1 Overview

Central Puget Sound Regional Transit Authority (Sound Transit) is proposing to expand Link light rail transit service from SODO to West Seattle. The West Seattle Link Extension Project (the project) is a 4.1-mile corridor in the city of Seattle in King County, Washington, the most densely populated county of the Puget Sound region (Figure 1-1). The project would include stations at SODO, Delridge, Avalon, and Alaska Junction. The project is part of the Sound Transit 3 Plan of regional transit system investments, funding for which was approved by voters in the region in 2016.

The Draft Environmental Impact Statement (EIS) published in January 2022 evaluated both the West Seattle Link Extension and the Ballard Link Extension together as one West Seattle and Ballard Link Extensions (WSBLE) Project. The extensions were evaluated together in the WSBLE Draft EIS because of their location, schedule, and review efficiencies for partner agencies.

In July 2022, the Sound Transit Board directed that further studies be prepared for the Ballard Link Extension, to evaluate additional station options and other refinements (Motion M2022-57). Some of these project options and refinements require additional conceptual engineering and environmental review. Rather than delay completion of the environmental review process for the West Seattle Link Extension while additional review is conducted for the Ballard Link Extension, Sound Transit and Federal Transit Administration (FTA) have decided to move forward under separate environmental reviews for each extension.

As described in the WSBLE Draft EIS, the two extensions will operate as separate lines, and the extensions are stand alone projects with independent utility. Proceeding with separate environmental review processes for each extension enables Sound Transit and FTA to minimize delay in delivering the West Seattle Link Extension while further analysis is undertaken on the Ballard Link Extension. Accordingly, this Final EIS is for the West Seattle Link Extension only. The Ballard Link Extension will undergo separate environmental review, building on the analysis that has already been completed.

Figure 1-1. West Seattle Link Extension Project Corridor

The West Seattle Link Extension would provide fast, frequent, and reliable light rail in Seattle and connect dense residential and job centers throughout the Puget Sound region. The Puget Sound Regional Council (the regional metropolitan planning organization) and the City of Seattle have designated the following Manufacturing/Industrial Center and urban village in the project corridor:

- **Manufacturing/Industrial Center.** The project corridor includes the Duwamish Manufacturing/ Industrial Center. SODO Station is in the Duwamish Manufacturing/Industrial Center.
- **Urban Village.** West Seattle Junction is a neighborhood in the project corridor designated by the City of Seattle as an urban village. The Alaska Junction and Avalon stations are in the West Seattle Junction Urban Village.

Puget Sound Regional Council

Puget Sound Regional Council, the regional metropolitan planning organization, develops policies and coordinates decisions about regional growth, transportation, and economic development planning within King, Kitsap, Pierce, and Snohomish counties. Puget Sound Regional Council is composed of over 80 jurisdictions, including all four counties; cities and towns; ports; state and local transportation agencies; and tribal governments within the region.

These designations indicate that these areas will continue to increase in residential and/or employment density over the next 30 years.

Existing local transit connections in the project corridor include bus and light rail. The King County Metro Transit (Metro) RapidRide C bus line currently provides service between West Seattle, Downtown Seattle, and South Lake Union. The RapidRide H bus line provides service between Burien and Downtown Seattle via Delridge. Other local bus service also operates in the project corridor.

Regional transit service in the project corridor includes regional bus service, ferry service, light rail, Sounder commuter rail, and Amtrak passenger rail service. Light rail currently operates between the Angle Lake Station in the city of SeaTac and Northgate Station in Seattle, traveling through the Downtown Seattle Transit Tunnel. There is an existing light rail station in SODO in the West Seattle Link Extension Corridor.

Extensions of light rail are under construction north to Lynnwood, east to Bellevue and Redmond, and south to Federal Way, all of which are anticipated to be operational by 2026. Additional planned light rail extensions would continue south to the Tacoma Dome, expected to begin service in 2035, and north to Everett, planned to begin service between 2037 and 2041. The Ballard Link Extension is scheduled to begin service between SODO and Ballard in 2039. The West Seattle Link Extension is scheduled to open in 2032 and would include a new SODO station where riders to and from West Seattle could transfer to the existing SODO station and light rail system until the Ballard Link Extension begins operation. The Ballard Link Extension would permanently connect the West Seattle Link Extension to the existing 1 Line, allowing riders to continue north to Everett. Figure 1-2 shows the full system planned for operation in 2042 under the target schedule. Table 1-1 lists the project Build Alternatives.

Figure 1-2. Link Light Rail System Expansion

1.2 Purpose of Report

This technical report focuses on the portions of the project that would be above ground and thus potentially visible. The existing visual and aesthetic conditions of the study area for the project are described, as are changes to existing visual conditions that would occur with each alternative or option. Existing City of Seattle regulations and ordinances related to visual and aesthetic resources are identified, and the consistency of the alternatives with the directives and objectives of those regulations and ordinances are discussed. This technical report concludes with a comparison of the potential impacts of each alternative on visual and aesthetic resources, a review of Sound Transit design measures that are intended to help project components fit with their visual environment, and mitigation measures to reduce visual impacts.

Table 1-1. Summary of West Seattle Link Extension Build Alternatives

Segment	Alternative or Design Option	Abbreviation	Stations (and Station Profile)	Connections
SODO	**Preferred At-Grade Lander Access Station Option**	**SODO-1c**	**SODO (At-Grade)**	**All Duwamish Segment alternatives.**
SODO	At-Grade Alternative	SODO-1a	SODO(At-Grade)	All Duwamish Segment alternatives.
SODO	At-Grade South Station Option	SODO-1b	SODO (At-Grade)	All Duwamish Segment alternatives.
SODO	Mixed Profile Alternative	SODO-2	SODO (Elevated)	All Duwamish Segment alternatives.
Duwamish (DUW)	**Preferred South Crossing Alternative**	**DUW-1a**	**None**	**All SODO Segment alternatives. All Delridge Segment alternatives.**
Duwamish (DUW)	South Crossing South Edge Crossing Alignment Option	DUW-1b	None	All SODO Segment alternatives. All Delridge Segment alternatives.
Duwamish (DUW)	North Crossing Alternative	DUW-2	None	All SODO Segment alternatives. All Delridge Segment alternatives.
Delridge (DEL)	**Preferred Andover Street Station Lower Height South Alignment Option**	**DEL-6b**	**Delridge (Elevated)**	**All Duwamish Segment alternatives. Connects to WSJ-5a and WSJ-5b.**
Delridge (DEL)	Dakota Street Station Alternative	DEL-1a	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-1, WSJ-2, and WSJ-4.
Delridge (DEL)	Dakota Street Station North Alignment Option	DEL-1b	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-1, WSJ-2, and WSJ-4.
Delridge (DEL)	Dakota Street Station Lower Height Alternative	DEL-2a	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-3a and WSJ-3b.
Delridge (DEL)	Dakota Street Station Lower Height North Alignment Option	DEL-2b	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-3a and WSJ-3b.
Delridge (DEL)	Delridge Way Station Alternative	DEL-3	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-1, WSJ-2, and WSJ-4.
Delridge (DEL)	Delridge Way Station Lower Height Alternative	DEL-4	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-3a and WSJ-3b.
Delridge (DEL)	Andover Street Station Alternative	DEL-5	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-1, WSJ-2, and WSJ-4.

Segment	Alternative or Design Option	Abbreviation	Stations (and Station Profile)	Connections
Delridge (DEL)	Andover Street Station Lower Height Alternative	DEL-6a	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-5a and WSJ-5b.
Delridge (DEL)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative	DEL-7	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-6.
West Seattle Junction (WSJ)	**Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option**	**WSJ-5b**	**Avalon (Retained Cut), Alaska Junction (Tunnel)**	**Connects to DEL-6a and DEL-6b.**
West Seattle Junction (WSJ)	Elevated 41st/42nd Avenue Station Alternative	WSJ-1	Avalon (Elevated), Alaska Junction (Elevated)	Connects to DEL-1a, DEL-1b, DEL-3, and DEL-5.
West Seattle Junction (WSJ)	Elevated Fauntleroy Way Station Alternative	WSJ-2	Avalon (Elevated), Alaska Junction (Elevated)	Connects to DEL-1a, DEL-1b, DEL-3, and DEL-5.
West Seattle Junction (WSJ)	Tunnel 41st Avenue Station Alternative	WSJ-3a	Avalon (Tunnel), Alaska Junction (Tunnel)	Connects to DEL-2a, DEL-2b, and DEL-4.
West Seattle Junction (WSJ)	Tunnel 42nd Avenue Station Option	WSJ-3b	Avalon (Tunnel), Alaska Junction (Tunnel)	Connects to DEL-2a, DEL-2b, and DEL-4.
West Seattle Junction (WSJ)	Short Tunnel 41st Avenue Station Alternative	WSJ-4	Avalon (Elevated), Alaska Junction (Tunnel)	Connects to DEL-1a, DEL-1b, DEL-3, and DEL-5.
West Seattle Junction (WSJ)	Medium Tunnel 41st Avenue Station Alternative	WSJ-5a	Avalon (Retained Cut), Alaska Junction (Tunnel)	Connects to DEL-6a and DEL-6b.
West Seattle Junction (WSJ)	No Avalon Station Tunnel Alternative	WSJ-6	Alaska Junction (Tunnel)	Connects to DEL-7.

2 INTRODUCTION TO RESOURCE, METHODOLOGY, AND REGULATORY REQUIREMENTS

2.1 Introduction to Visual and Aesthetic Resources

Visual and aesthetic resources are the landscape's natural and cultural features that can be seen and contribute to the public's appreciation and enjoyment of their surroundings. These resources include elements from both the built and natural environments. They can include solitary built and natural landmarks (such as buildings, trees, and bodies of water) or entire landscapes. For this technical report, impacts to visual and aesthetic resources are defined in terms of the extent to which the project alternatives would change the visual character and visual quality of the resources.

2.2 Methodology

Sound Transit used a methodology specifically designed to analyze the visual impacts of linear rail projects in an urban setting. Sound Transit's methodology draws upon established Federal Highway Administration guidelines (Federal Highway Administration 1988) with several key differences, such as the identification of viewer sensitivity, and the use of a qualitative rather than quantitative scale. The *Guidelines for the Visual Impact Assessment for Highway Projects* (Federal Highway Administration 2015) were also consulted. Sound Transit's methodology was applied by professionally credentialed landscape architects. For linear projects such as the West Seattle Link Extension, it is important to select locations that can serve as representatives of areas found along routes of a proposed project from which the project would be seen. These locations are called key observation points (KOPs) and are used to depict current views toward a proposed project and how the views would change with the project. The KOPs that are used in this technical report represent a variety of types of viewer locations and a variety of locations within the project limits that would be seen by different types of viewers. The locations were selected with input from the City of Seattle to represent the proposed project in areas where there is a potential for visual impacts. The locations selected were those where it was possible to gain access to the KOP with an unobstructed view of the proposed project.

The impact assessment conducted in this technical report focuses on changes to the landscape that would be seen by sensitive viewers. People who view and experience a landscape (viewers) have low, medium, or high sensitivity to changes in the viewed environment. Viewer sensitivity is strongly influenced by a viewer's awareness of their surroundings, the activities they are engaged in, and the amount of time spent looking at a view (viewer duration). People, such as residents and park users, who see a landscape multiple times for long periods of time and are familiar with it would be aware of changes in the landscape and have high viewer sensitivity. People who are less familiar with a landscape, are engaged in activities that may require their attention (such as workers) or are viewing it for short periods of time (such as motorists) are not considered to have high viewer sensitivity. In this assessment, people who have high sensitivity to changes in the viewed environment are called sensitive viewers. People using a recreational designated facility (such as a trail designated for walking, bicycling, or other non-motorized recreational purpose) were identified as sensitive viewers, but pedestrians or bicyclists using a transportation-designated facility (such as a sidewalk) are not considered sensitive viewers because they are primarily using these facilities to get from one location to another. An exception to this the West Seattle Bridge Trail because the Spokane Street Bridge is designated as a City of Seattle Designated Scenic Route (see Section 2.3, Regulatory Requirements).

The Federal Highway Administration methodology evaluates changes to the visual character of a view that would be seen by sensitive viewers as well as changes to visual quality. Visual character is a non-evaluative description of a viewed landscape. Visual character can describe a landscape in terms that many people understand. For example, a neighborhood in a new subdivision might be said to have a suburban, residential visual character. Most people would have an image of what the neighborhood looks like. Other examples of visual character types include industrial, rocky shoreline, and high school campus. These descriptions do not assign "value" or "degree of beauty," they just describe the appearance of an area. Where conflicts in visual settings can occur is when an object of one visual character type (like a factory with an industrial character) is placed in or next to another visual character type (like a high school campus) and visual incompatibility results.

Visual quality does assign "value" or "degree of attractiveness" to a viewed landscape so that changes from a proposed project can be determined. The Federal Highway Administration methodology uses a quantitative approach to determine visual quality. It starts with a description of views of a landscape and seeks to understand: Is this particular view common or dramatic? Is it a pleasing composition (with a mixture of elements that seem to belong together) or not (with a mixture of elements that either do not belong together or are visual intrusions that contrast with the other elements in the surroundings)? Visual quality is evaluated in terms of three components: vividness, intactness, and unity. The three components that together determine visual quality are described below.

- Vividness is the degree of drama, memorability, or distinctiveness of the landscape. Vividness is composed of four elements—landform, vegetation, water features, and human-made elements—that usually influence the degree of vividness.
- Intactness is a measure of the visual integrity of the natural and human-built landscape and its freedom from encroaching elements. Intactness is composed of two primary elements—development and encroachment—that influence the degree of intactness.
- Unity is the degree of visual coherence and compositional harmony of the landscape when it is considered as a whole. High unity frequently attests to the careful design of individual components and their relationship in the landscape.

The three components of visual quality are rated numerically and are considered together to determine overall visual quality. The Federal Highway Administration methodology uses a seven-point scale to rate each of the three components and then divides the totals by three to produce an overall visual quality rating that can be anywhere from 1 (very low) to 7 (very high). The fairly complex seven-point Federal Highway Administration scale was simplified for this analysis to three general levels of visual quality: low, average, and high. The descriptions of the three simplified visual quality categories are described below:

- Low Visual Quality – Areas with low visual quality have some combination of features that seem visually out of place, lack visual coherence, do not have compositional harmony, and/or might contain unsightly elements.
- Average Visual Quality – Areas with average visual quality are commonly occurring or average-appearing landscapes that have a generally pleasant appearance but might lack enough vividness (distinctiveness, memorability, and drama), intactness (the elements in the views "fit" with their natural and human-built surroundings), and unity (compositional harmony) to place them in the high visual quality category. This is generally the most frequent category. In this analysis, a view with high average visual quality would have vividness, intactness, and unity characteristics that are slightly higher than average but not high enough to qualify as high. Likewise, a view with low average would have slightly lower than average vividness, unity, and intactness characteristics, but not enough to be considered to have low visual quality.

- High Visual Quality – Areas with high visual quality must be outstanding in terms of being very memorable, distinctive, unique (in a positive way), and/or intact—they can be natural, park-like, or urban, with urban areas displaying strong and consistent architectural and urban design features.

Because the vast majority of the visual quality of the study area is average, the average category was further refined to high average, average, and low average. This refinement assisted in describing changes to visual quality from alternatives in situations where the existing average visual quality of a view from a KOP might be lowered but still remain in the "average" category. By using high average, average, and low average, a better description of the influence of a Build Alternative on visual quality could be made. For example, if a Build Alternative lowered the existing high average visual quality of a view from a KOP to low average, that information would be important to know, rather than simply stating the average visual quality of the view from a KOP would remain average with that Build Alternative.

The study area for visual and aesthetic resources is the portion of the viewshed of the Build Alternatives that would be clearly seen by sensitive viewers. A viewshed is the geographical area from which an object is visible and can include all surrounding points that are in line-of-sight with that object and excludes points that are beyond the horizon or obstructed by terrain and other features (such as buildings and trees). In many locations along the alignments of the alternatives, sensitive viewers' views of project components such as guideways, stations, trains, hi-rail vehicle access required for maintenance, and vent shafts for tunnels would be partially or completely blocked by vegetation, terrain, and buildings. In densely developed areas, the alternatives' viewshed is frequently between approximately 100 feet and 500 feet on either side of the alignment.

This 100-foot to 500-foot distance is considered the study area for this assessment. In areas where above-grade project components would be higher than nearby buildings and vegetation, the components could be visible beyond 500 feet. Given the developed urban nature of the areas through which the Build Alternatives would pass and the many features (such as buildings of varying sizes, streets, bridges, and trees) that are already viewed in these areas, being able to see project components beyond approximately 500 feet would generally not alter the visual character or visual quality of views. Where Build Alternatives would cross waterbodies, their bridges would be clearly seen beyond 500 feet. In these situations, the study area is extended out to approximately 0.5 mile on either side of the alternative.

This assessment considered changes to the viewed environment that would be seen by areas with concentrations of sensitive viewers within the study area at the distances described above (between approximately 100 feet and 500 feet from the alignments on land and within approximately 0.5 mile from the alignments on water). The Federal Highway Administration methodology recognizes that the greater the number of people who would have their views altered by a proposed project, the greater the potential impact of a proposed project would be. By focusing on areas with concentrations of sensitive viewers, impacts associated with the various alternatives can be compared.

The following factors were used to assess how the Build Alternatives would affect visual and aesthetic resources:

- Changes to visual character near areas with concentrations of sensitive viewers (this is a qualitative description).
- Changes to the visual quality of views towards the Build Alternatives near areas with concentrations of sensitive viewers. If the visual quality category would be lowered one category or more (high to average or average to low), the change was considered an impact.

- Potential blockage of or intrusion on existing views from scenic routes and public places identified in Seattle Municipal Code Section 25.05.675.P, Public View Protection. Areas where alternatives would interrupt or block views were qualitatively described.

Of the factors identified above, the primary factor used to assess potential impacts from the alternatives was change to the visual quality of views towards the Build Alternatives that would be seen from areas with concentrations of sensitive viewers. Attachment N.2A, Key Observation Point Analysis, contains reduced-scale existing condition photographs of views from each KOP toward various alternative alignments; reduced-scale conceptual simulations (based on the degree of detail available at the time the simulation was produced) of the view with the various Build Alternatives in place; and detailed evaluations that describe if, how, and why the various alternatives that were simulated for each KOP would change the existing visual quality of the views. The findings in Attachment N.2A were then extrapolated to assist in assessing impact levels to areas that were similar to the areas represented by the KOPs.

2.3 Regulatory Requirements

The project would be within the Seattle city limits. The Seattle Municipal Code contains several policies and regulations of relevance to visual and aesthetic resources. One of the codes most relevant in terms of assessing potential impacts to visual and aesthetic resources is Seattle Municipal Code Section 25.05.675. Several Section 25.05.675 policies are relevant to the project, including the following:

- Policy P, Public View Protection – This policy contains directives that guide the protection of public views of “significant natural and human-made features” seen from specific public places such as viewpoints, parks, scenic routes, and view corridors that are identified in Policy P. The features in Policy P that are of potential relevance to this technical report are the Olympic Mountains, the Cascade Mountains, Mount Rainier, Puget Sound, Elliott Bay, and views of the downtown skyline. Attachment 1 to Policy P is a list of public places consisting of the specified viewpoints, parks, scenic routes, and view corridors which contain relevant views of the Olympic Mountains, the Cascade Mountains, Mount Rainier, Puget Sound, Elliott Bay, and views of the downtown skyline. Attachment 1 also includes two exhibits, Exhibit 1 – SEPA Scenic Routes Map North Seattle and Exhibit 2 – SEPA Scenic Routes Map South Seattle. The two exhibits identify scenic routes described as “Seattle Engineering Department, Traffic Division map and designated by Ordinance 97025” and “Scenic routes identified as protected view rights of way in the Seattle Mayor’s April 1987 Open Space Policies Recommendation.” The routes shown on these exhibits are collectively described in the figures and text of this technical report as City of Seattle Designated Scenic Routes and are shown on Figures 3-1 to 3-3 in Chapter 3, Affected Environment.

  Policy P also strives to protect public views of historic landmarks designated by the Landmarks Preservation Board that, because of their prominence of location or contrasts of siting, age, or scale, are easily identifiable visual features of their neighborhood or the city and contribute to the distinctive quality or identity of their neighborhood or the city.

- Policy K, Light and Glare – This policy states that “Development projects sometimes include lighting and/or reflective surface materials which can impact motorists, pedestrians, and the surrounding area.” Potential impacts from light and glare are discussed in this technical report, as are mitigation measures. Policy K of Section 25.05.675 is subject to the overview policy set forth in Section 25.05.665.

- Policy Q, Shadows on Open Spaces – The policy describes areas outside of Downtown Seattle where it is desirable to minimize or prevent "light blockage and the creation of shadows on open spaces most used by the public." These areas include public parks, public schoolyards, private schools that allow the public use of schoolyards during non-school hours, and publicly owned street ends in shoreline areas. Potential impacts from shadows on open spaces are discussed in this technical report. Policy Q of Section 25.05.675 is subject to the overview policy set forth in Section 25.05.665.
- Policy G, Height, Bulk and Scale – This policy states that it is City of Seattle policy that the "height, bulk, and scale of development projects should be reasonably compatible with the general character of development anticipated by the goals and policies set forth in the Land Use Element, Growth Strategy Element, and Shoreline Element of the Seattle Comprehensive Plan." There are places where the height of the stations would be higher than what is allowed under City zoning. The existing visual character of areas along the alternative alignments and near proposed stations is very generally described in this technical report, as are potential changes to visual character from the Build Alternatives. Policy G of Section 25.05.675 is subject to the overview policy set forth in Section 25.05.665.

This page is intentionally left blank.

3 AFFECTED ENVIRONMENT

Although the project would pass through four segments (SODO, Duwamish, Delridge, and West Seattle Junction), this section does not address the SODO Segment or the portion of the Duwamish Segment east of Harbor Island. It focuses on segments and portions of segments that contain areas with concentrations of sensitive viewers who would potentially be concerned with changes to the visual and aesthetic settings from the project. The SODO Segment and eastern part of the Duwamish Segment do not meet that criteria. Figures 3-1 through 3-3 show the locations of areas with concentrations of sensitive viewers as well as KOPs and the view directions of the KOPs that were used to depict existing views toward the alternative alignments. Attachment N.2A includes existing condition photographs from all of the KOPs in these segments and describes the existing views from each KOP and how the visual quality categories of the views were determined. Table 3-1 lists the location of KOPs and the associated sensitive viewers. See Chapter 2, Alternatives Considered, and Appendix J, Conceptual Design Drawings, of the Final EIS for more information on the aboveground elements that would be potentially seen by sensitive viewers.

3.1 SODO Segment

The description of the affected environment focuses on areas that contain concentrations of sensitive viewers. Although there may be isolated sensitive viewers within the SODO Segment, the segment does not contain areas with concentrations of sensitive viewers and therefore is not addressed in this section.

3.2 Duwamish Segment

The eastern part of the Duwamish Segment does not contain areas with concentrations of sensitive viewers. The portion of the Duwamish Segment where there are concentrations of sensitive viewers, which was evaluated for this technical report, begins at Harbor Island, heads west over the Duwamish Waterway (also known as the Duwamish River), proceeds up and over the top of Pigeon Point, and slopes down to 23rd Avenue Southwest (the boundary of the Duwamish and Delridge segments). The Duwamish Waterway is near three areas with concentrations of sensitive viewers (recreationists) that would be near project alternatives: Terminal 18 Park, which is north of the West Seattle Bridge; Harbor Marina Corporate Center at Terminal 102 (a thin strip of land with some vegetation along three sides of the south end of Harbor Island along the shoreline between an office park and parking lots); and t̓uʔəlaltxʷ Village Park and Shoreline Habitat, which is south of the West Seattle Bridge. The West Seattle Bridge, which passes above this area, is a very strong visual presence. The visual quality of views up and down the Duwamish Waterway from these two recreational areas is low to average.

Two streets (17th Avenue Southwest and 18th Avenue Southwest) containing single-family residences within the Riverside community are situated at the bottom of the Pigeon Ridge slope, which also contains the West Duwamish Greenbelt. This pocket of residences in an otherwise industrial area has a residential character, and the adjacent greenbelt has a natural character. The visual quality of views from the residences to the north toward the West Seattle Bridge is generally low.

Table 3-1. Description of Key Observation Points (KOPs)

KOP #	Location of KOP/Sensitive Viewers Represented
WS-1	Highway 99 Viaduct southbound lane/South Horton Street, looking southwest; no sensitive viewers
WS-2	West Seattle Bridge Westbound Looking South; no sensitive viewers
WS-3	View from t̓uʔəlaltxʷ Village Park and Shoreline Habitat Looking North; visitors at Village Park and Shoreline Habitat
WS-4	Terminal 18 Park, Looking Southwest; park visitors
WS-5	West Seattle Bridge Westbound, Looking West toward Pigeon Point
WS-6	Southwest Spokane Street/West Seattle Bridge Trail Looking Southwest toward Mount Rainier; pedestrians and non-motorized traffic.
WS-7	17th Avenue Southwest Looking North; Riverside neighborhood residents
WS-8	West Seattle Bridge Westbound Looking North
WS-9	Looking North from Southwest Charlestown Street and 20th Avenue Southwest
WS-10	West Seattle Bridge Eastbound Lane, 300 Feet West of 23rd Avenue Southwest Right-of-Way, Looking Southeast; no sensitive viewers
WS-11	Looking West along Southwest Andover Street toward Delridge Way Southwest
WS-12	Looking North Along Delridge Way Southwest
WS-13	Looking Northwest from Delridge Playfield
WS-14	Looking North along 26th Avenue Southwest
WS-15	Looking West along Southwest Genesee Street from near Longfellow Creek
WS-16	Longfellow Creek Legacy Trailhead on Southwest Yancy Street, Looking North
WS-17	Dragonfly Garden on 28th Avenue Southwest Looking toward Longfellow Creek Natural Area
WS-18	Southwest Avalon Way Looking South
WS-19	Southwest Yancy Street Looking East from Intersection at 30th Avenue Southwest
WS-20	Looking Past the North End of the West Seattle Golf Course
WS-21	Looking East along Southwest Genesee Street from Southwest Avalon Way
WS-22	Intersection of Southwest Yancy Street and 32nd Avenue Southwest Looking South
WS-23	Southwest Avalon Way Looking Northeast
WS-24	Southwest Avalon Way Looking North at Intersection with Southwest Genesee Street
WS-25	32nd Avenue Southwest Looking Northeast
WS-26	35th Avenue Southwest Looking South near Intersection with Fauntleroy Way Southwest
WS-27	35th Avenue Southwest Looking North at Intersection with Southwest Avalon Way
WS-28	Southwest Genesee Street Looking East toward Southwest Avalon Way
WS-29	Looking Southwest along Fauntleroy Way Southwest from 35th Avenue Southwest
WS-30	39th Avenue Southwest Looking South toward Fauntleroy Way Southwest
WS-31	42nd Avenue Southwest near Southwest Hudson Street

The Duwamish Segment continues west upslope to the top of Pigeon Point and a residential area known as the Pigeon Point community. Southwest Charleston Street, 19th Avenue Southwest, 20th Avenue Southwest, and 21st Avenue Southwest pass along the top of Pigeon Point.

The West Duwamish Greenbelt serves as a backdrop to this residential area, and trees within it block views of the industrial and commercial areas that lie to the north. This area has a residential character and the existing visual quality of views to the north and northwest from residences in these areas is generally high.

As the segment continues west, it travels downslope and includes additional streets in the Pigeon Point community (21st Avenue Southwest, 22nd Avenue Southwest, and 23rd Avenue Southwest) with residences. Both 21st Avenue Southwest and 22nd Avenue Southwest dead-end against the edge of the West Duwamish Greenbelt, and 23rd Avenue Southwest connects with Delridge Way Southwest. Trees in the West Duwamish Greenbelt, along streets, and within yards block views to the north and west from many of the residences on these streets of the Delridge Way Southwest-West Seattle Bridge on-ramp, the West Seattle Bridge, and industrial-commercial areas beyond them. These residential streets have a residential character and, due to nearby vegetative screening, the visual quality of views from the residences is generally average.

East Marginal Way South, State Route 99, the Spokane Street Bridge, and the West Seattle Bridge are City of Seattle Designated Scenic Routes. There are no relevant City of Seattle protected views in this segment along East Marginal Way South, which primarily offers views of industrial lands and Port Terminal activities, including docks and piers that are not considered to be protected views. The bridge offers views of the Olympic Mountains, the Cascade Mountains, Mount Rainier, Puget Sound, Elliott Bay, and the downtown skyline. The views from the portion of the West Seattle Bridge at Longfellow Creek offers views of the downtown skyline, the Cascade Mountains, and partial views of Elliott Bay.

3.3 Delridge Segment

This segment includes alternatives that would pass through several areas within the overall Delridge Segment area. Several alternatives would begin near the northwest corner of Pigeon Point. Part of the segment continues south along Delridge Way Southwest, and the other part heads west along Southwest Andover Street past the Nucor Steel complex. The residential area on the slope east of Delridge Way Southwest has an established residential visual character (with many mature trees that block views to the west). The visual quality of views to the west is average to high average. The area west of this part of Delridge Way Southwest (south to Southwest Dakota Street) contains commercial buildings (mostly office) and large parking areas. It has a commercial character, low to average visual quality, and no areas with concentrations of sensitive viewers.

The neighborhood south of Southwest Dakota Street, east of Delridge Way Southwest, north of Southwest Genesee Street, and east of the Longfellow Creek Natural Area is composed of several blocks. This area is residential in visual character, contains sensitive residential viewers, and generally has average visual quality. The area south of Southwest Genesee Street contains the Delridge Playfield and Community Center as well as the West Seattle Golf Course, with residences between them along the west side of 26th Avenue Southwest. Delridge Playfield has high visual quality. The heavily vegetated Longfellow Creek Natural Area passes from north to south through the center (and low elevation point) of the Delridge Segment and is an important visual feature. An entrance to the trail that follows the Longfellow Creek Natural Area (the Longfellow Creek Legacy Trail) is on the north side of Southwest Genesee Street and is used by recreationists (sensitive viewers) accessing the trail. These greenspaces, along with the

mature trees that line edge of Southwest Genesee Street, greatly influence the appearance of this part of the segment and create an open-space, park-like visual character. The portion of the Delridge Segment north of Southwest Genesee Street passes by residences east of the Longfellow Creek Natural and continues west uphill next to additional residences to the segment's end. The residential area north of Southwest Genesee Street has a residential visual character along with views of high average visual quality.

The West Seattle Golf Course has a recreational visual character and contains visually distinctive elements associated with golf courses, such as fairways, greens, sand traps, and paths. It supports many mature trees, including trees that line much of the north side of the golf course along the edge of Southwest Genesee Street. These trees form the northern backdrop of the golf course and tend to screen views of the residences to the north. Some openings in the line of trees, however, allow views of the downtown skyline. People at the West Seattle Golf Course are sensitive viewers, and the visual quality of views to the north they see is generally high.

The northern part of the Delridge Segment continues west along Southwest Andover Street past industrial and commercial areas before slowly curving to the southwest, reconnecting with Southwest Andover Street, and entering the residential neighborhood between Southwest Andover Street and the West Seattle Bridge. Multi-family residential buildings line this part of Southwest Andover Street, while there are single-family residences along the streets (32nd Avenue Southwest and Southwest Yancy Street) to the west. This area has a residential visual character, sensitive residential viewers, and views of generally average visual quality. The area along the east end of Southwest Yancy Street is also characterized as a forested recreational area and includes the Longfellow Creek Natural Area and the trailhead to Longfellow Creek Legacy Trail. The sensitive viewers to the north from this trailhead have an average visual quality due to extent of existing vegetation and northerly views of the commercial and industrial buildings.

The on-ramps to the West Seattle Bridge are a City of Seattle Designated Scenic Route, although views to the east from this portion of the scenic route are blocked by adjacent trees to the east side (which block views of it from adjacent residences facing 32nd Avenue Southwest).

The City of Seattle protected views (other than scenic routes) in this segment are the West Seattle Golf Course and the West Seattle Rotary Viewpoint; however, the views from the West Seattle Rotary Viewpoint to the West Seattle Bridge on-ramps are blocked by adjacent trees and residential buildings. The West Seattle Golf Course was selected as a KOP.

3.4 West Seattle Junction Segment

The eastern boundary of the West Seattle Junction Segment begins at the segment boundary and heads west across Southwest Avalon Way and Southwest Genesee Street to Fauntleroy Way Southwest. It then generally follows Fauntleroy Way Southwest to the Alaska Junction area. There are four distinct subsections in this segment.

The first subsection consists of the residential neighborhood between Southwest Avalon Way on the east and Fauntleroy Way Southwest on the west. Multi-family buildings line both sides of Southwest Avalon Way. Single-family residences are found along Southwest Genesee Street and 32nd Avenue Southwest. This neighborhood is somewhat elevated, and some of the multi-family residential buildings have views of the West Seattle Golf Course and nearby areas. The visual character of this area is residential, and the visual quality of views is generally average. There are sensitive residential viewers throughout this subarea.

The second subsection follows the Fauntleroy Way Southwest corridor as it travels southwest and uphill from its intersection with Southwest Avalon Way to the Alaska Junction area. This part of Fauntleroy Way Southwest angles through the generally north-south/east-west street grid pattern of West Seattle. Land uses along this part of Fauntleroy Way Southwest are largely commercial and oriented to the street and/or have parking areas that provide easy street access to customers. The character of this part of the corridor is commercial, and the visual quality is average to low. Sensitive viewers along this portion of Fauntleroy Way Southwest are people using Fauntleroy Place, a small open space between three streets, including Fauntleroy Way Southwest. Areas to the northwest and uphill from the commercial part of Fauntleroy Way Southwest are residential in use and character and contain concentrations of sensitive residential viewers. The area between 36th Avenue Southwest and 42nd Avenue Southwest is primarily composed of single-family residences. Streets in this area are lined with trees, and many of the residences' yards contain additional trees that block views of Fauntleroy Way Southwest. The area has a strong single-family residential character, and the visual quality of this area is generally average. The western part of this subsection north of Southwest Alaska Street contains mixed use, with some multi-family residential buildings. This area has a more urban character, contains many sensitive residential viewers, and has views that are generally of average visual quality.

The third subsection, which encompasses the blocks west and south of the Fauntleroy Way Southwest and Southwest Alaska Street intersection and north of Southwest Edmonds Street, has a very urban visual character. The blocks in this area have a generally pleasant appearance similar to many redeveloping areas in Seattle. The visual quality of views from residences in this area is generally average. Sensitive viewers are composed primarily of residents who view the surrounding area from multi-family buildings, ranging from one to approximately six stories in height.

The last subsection is the residential area south of Southwest Edmunds Street. This area is primarily single-family residential in use and visual character, although multi-family buildings line the east side of California Avenue Southwest. Sensitive residential views are found throughout this area, and the visual quality of views in this area is generally average.

Three City of Seattle Designated Scenic Routes are within the West Seattle Junction Segment: the southwestern portion of the West Seattle Bridge, a portion of Fauntleroy Way Southwest from the off-/on-ramps, and along 35th Avenue Southwest parallel to the West Seattle Golf Course. Key features that can be seen from Fauntleroy Way Southwest are limited because of views are blocked by terrain, vegetation, and buildings. Depending upon location along the southern end of 35th Avenue Southwest, there are views of the Cascade Mountains, and the downtown skyline. Other than the City of Seattle Designated Scenic Routes, there are no relevant City of Seattle protected views in this segment.

4 ENVIRONMENTAL IMPACTS

The project Build Alternatives evaluated in this section are shown on Figures 3-1 through 3-3. Chapter 2, Alternatives Considered, and Appendix J, Conceptual Plans, of the Final EIS provide more information on above-ground components of the project. Attachment N.2A includes existing conditions photographs from all of the KOPs in the study area, reduced-scale simulations of alternatives developed for the KOPs, and detailed descriptions of if how, and to what degree the alternatives would change the visual quality of views from the KOPs. Because none of the KOPs are located within the SODO Segment, the SODO alternatives listed in Table 1-1 are not shown on Figures 3-1 through Figure 3-3, nor were they evaluated.

4.1 No Build Alternative

With the No Build Alternative, the existing visual and aesthetic conditions found throughout the segments described in the affected environment would generally be maintained, subject to changes related to planned development. With the No Build Alternative, light rail stations would not be built in the Delridge, Avalon, and Alaska Junction areas. Development would continue to occur in accordance with zoning and would evolve into denser multi-family development in the Delridge area, along Southwest Avalon Way, with more mixed use in the Alaska Junction area. It is likely that density in the West Seattle Junction area would continue to increase and that some of the less developed parcels of land would be redeveloped and contribute to the increasingly urban character of this area.

4.2 Build Alternatives

4.2.1 Impacts Common to All Build Alternatives

All of the project Build Alternatives would change the visual environments to varying degrees. Figures 3-1 through 3-3 depict the project alternative alignments and proposed profile (at-grade, elevated, trench, or tunnel). The construction and operation of the Build Alternatives would require the removal of a variety of existing visual features such as buildings and vegetation (including trees) in landscaped areas, on slopes, and within parking lots. Some streets would require minor widening, which could require the removal of street trees, and others would require cut-and-cover construction where the alternative would pass beneath them in a trench that would be covered after construction. Tunnel alignments would not be visible after construction, with the exception of station entrances and vent/egress shafts. Table 4-1 identifies the main components of the project alternatives and describes their visual characteristics. As detailed in Section 5.2, Sound Transit Design Measures, Sound Transit has developed design measures that would also be incorporated into the Build Alternatives.

Table 4-1. Visual Characteristics of Project Components

Project Component	Visual Characteristics and Notes
Elevated Guideways or Structures (guideway columns, straddle bents) [a]	These are often the most visible project elements. The bottom parts of elevated guideways and hi-rail access would range between approximately 20 feet and 170 feet in height with the project. Noise barriers near sensitive receivers could add several additional feet to the height of the elevated guideways. Elevated hi-rail access ramps would be required to reach and maintain elevated guideways. In some locations, elevated guideways (and their associated overhead catenary system) could intrude on views of features such the Cascade and Olympic Mountains. Mount Rainier, Elliott Bay, Puget Sound and the downtown skyline. Elevated stations (and guideways to a lesser extent) could create shadows that could have impacts. However, stations and associated structures such as elevators, escalators, and walkways as well as underground stations egress/vent structures would be designed to be attractive architectural elements or features and would add visual interest to the nearby area.
Bridges	The bridges over the Duwamish Waterway would be the most visible structure as seen from a distance associated with the project (see Figure 4-1). High-level fixed bridge structure types could include balanced cantilever segmental box girder, extradosed, cable-stayed, or truss superstructure over the West Waterway. Preferred Alternative DUW-1a over the West Waterway would be constructed as either truss or cable-stayed and the East Waterway would be crossed by a balanced cantilever segmental box girder. For Option DUW-1b and Alternative DUW-2, all bridge types over the West Waterway are still being considered. The project would include a balanced cantilever segmental box girder over the East Waterway for all alternatives.
Stations	Depending on size, bulk, and whether they would be elevated, retained cut, or at-grade, stations could block or intrude on views of features such as the Cascade Mountains, Mount Rainier, Elliott Bay, Puget Sound, and the downtown skyline; cast shadows; or add built elements to the landscape. Elevated stations would be more visible than stations in retained cuts or tunnels and would contain features such as escalators, elevators, and stairs. The only at-grade station would be in SODO.
Overhead Catenary System	The overhead catenary system can be a very visible component from close viewing distances. Overhead catenary system elements (wires and poles) become less visible as viewing distances increase. The structures could intrude on views but would not block views because of their thin, cable-like profile and appearance.
Lighting and Glare Associated with Stations	Project-related lighting at stations could create light impacts, increase the level of ambient light nearby, and increase skyglow, which can impact nighttime views of the stars. Design-related measures such as shielding and altering light direction in stations would be used where appropriate to reduce potential impacts. Glare impacts from the project Build Alternatives would be unlikely. “Glare” is defined by the online Merriam-Webster Dictionary as “a harsh uncomfortably bright light” (Merriam-Webster 2020); given this definition, potential reflection from stations might be seen under certain conditions and at certain times of the day, but would not be likely to produce harsh, uncomfortable bright light that would be a safety issue to vehicle drivers.
Lighting Associated with Trains	Lights from the interior of project light rail trains and train headlights would be seen at night in some locations as the light rail passes viewers, although some noise barriers on elevated structures near sensitive viewers would block views of interior train lights and/or train headlights, particularly when looking upward at trains traveling above viewers on elevated guideways. Briefly seeing light associated with passing light rail trains would not be expected to create visual disturbances, given the existing level of traffic on streets at night on most streets near the Build Alternatives. Some sensitive viewers living in residences that would be adjacent to elevated structures might find passing nighttime light rail visually disturbing.
Building Removal	Removal of existing buildings can improve or detract from visual settings, depending on building condition, style, scale, and color. Areas where buildings would be removed would contain project elements and/or be revegetated to better blend in with nearby areas.

Project Component	Visual Characteristics and Notes
Vegetation Removal	Removal of vegetation can open up views that are nonexistent or, conversely, expose other unsightly views, such as industrial areas below sensitive viewers that are currently blocked by vegetation. When possible, Sound Transit would preserve existing vegetation as practical, replant vegetation, replace trees, and screen to minimize effects of vegetation removal.
Retaining Walls	Retaining walls often replace vegetated hillsides with hard materials such as concrete that might require surface design treatments to reduce impacts. Where appropriate, retaining walls would be treated with surface design enhancements.
Sound Walls	Sound walls or noise barriers could be installed near sensitive noise receivers. They are built of solid materials and placed adjacent to or attached to the light rail guideway (see Figure 4-2). When these measures are not effective, sound walls might be constructed along property lines, sometimes replacing existing fences. The proposed locations of sound walls are shown in Appendix N.3, Noise and Vibration Technical Report, and were considered in the visual impact analysis.
Retained Cut	Retained cut for light rail would only be visible from nearby areas. Fencing and/or walls along the top of the retained cut would be the most visible elements of this feature and would be appropriately designed to fit in with the adjacent properties.
Traction Power Substations	The traction power substations would be in enclosed buildings, about 20 feet by 60 feet in size, with an additional 10 to 20 feet required around each unit. Where appropriate, they would be screened from public view with a wall or fence. The exterior walls or fences would be landscaped in accordance with the landscape regulations of the jurisdictions where the facilities would be located.
Tunnel Egress and Vent Shaft Structure	The tunnel egress and vent shaft structure would provide access from tunnels to the surface and provide a way for the vent shaft to vent above the surface. The structure would be a building approximately 30 feet by 30 feet and 25 feet in height above-grade.

[a] Guideway columns are structures that hold up elevated guideways. Straddle bents are supports made of two guideway columns that support a beam on which the elevated guideway sits.

Figure 4-1. Bridge Structure Types Illustration

Figure 4-2. Sound Wall on Elevated Guideway

4.2.2 Duwamish Segment

Table 4-2 identifies locations within the Duwamish Segment where there would be visual impacts (a reduction of one or more visual quality categories) near areas with concentrations of sensitive viewers. These sensitive viewer locations are identified on Figure 3-1. The following subsections describe how the alternatives would, or would not, impact the visual quality of views toward them from areas with concentrations of sensitive viewers. It then identifies alternative components that would be seen from City of Seattle Designated Scenic Routes and whether those components would intrude upon or block views of important visual resources identified by the City. Sound Transit is considering several bridge types for Option DUW-1b and Alternative DUW-2, including balanced cantilever segmental box girder, extradosed, truss, and cable-stayed bridges for crossing over the West Waterway. Each of these bridges would have different visual characteristics as described in the following subsections. The subsection concludes with a discussion about light and glare that would be associated with the alternatives as well as identifying where the alternatives would cast shadows on open spaces used by the public.

Table 4-2. Duwamish Segment Visual Quality Impacts near Concentrations of Sensitive Viewers

Alternative or Design Option	Visual Impacts (miles) [a]	Where Visual Quality Impacts Would Occur
Preferred South Crossing Alternative (DUW-1a)	**0.1**	**Residences along 21st Avenue Southwest, 22nd Avenue Southwest, and 23rd Avenue Southwest**
South Crossing South Edge Crossing Alignment Option (DUW-1b)	0.1	Residences along 21st Avenue Southwest, 22nd Avenue Southwest, and 23rd Avenues Southwest
North Crossing Alternative (DUW-2)	0	None

[a] Visual impacts occur when an existing visual quality category (high, average, low) is reduced one or more categories. Visual impacts are in miles along the length of the alternative or option adjacent to concentrations of sensitive viewers.

4.2.2.1 Preferred South Crossing Alternative (DUW-1a)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Preferred Alternative DUW-1a would pass near several distinct areas with concentrations of sensitive viewers. This alternative would continue west and to the south side of the West Seattle Bridge. Where Preferred Alternative DUW-1a would cross State Route 99, the alignment would be higher than the West Seattle Bridge and would gradually increase in height as it travels west because light rail cannot travel on grades as steep as automobiles can. This alternative would cross over the East Waterway, Harbor Island, and the West Waterway on a fixed, light-rail-only bridge. It would pass over and place a guideway column in Harbor Marina Corporate Center at Terminal 102. This alternative's bridge would add additional large-scale transportation elements to views from both Harbor Marina Corporate Center at Terminal 102 and t̓uʔəlaltxʷ Village Park and Shoreline Habitat (represented in KOP WS-3) The presence of the bridge's guideway column would somewhat change the character of the view from Harbor Marina Corporate Center at Terminal 102 but would not further reduce the average visual quality of the views from either park.

The bridge for Preferred Alternative DUW-1a would pass south of the West Seattle Bridge and be seen from the Riverside community from residences along 17th Avenue Southwest and 18th Avenue Southwest (represented in KOP WS-7; see Figure 2-7b in Attachment N.2A). It would add an additional large-scale infrastructure element to the northern view from this residential area. The existing low visual quality category of views toward Preferred Alternative DUW-1a would not change.

Sound Transit is considering multiple bridge types for crossing the Duwamish Waterway. In addition to the balanced cantilever segmental box girder bridge depicted in the simulations (Attachment N.2A) over the East Waterway. Over the West Waterway, Sound Transit is considering a truss or cable-stayed bridge for Preferred Alternative DUW-1a (represented in KOP WS-1).

The balanced cantilever segmental box girder bridge crossing the East Waterway would be narrower in width than the cable-stayed or the truss on the West Waterway. The bridge would be very similar to the existing West Seattle Bridge in scale, form, materials, and overall appearance. Its bridge deck would be supported by a series of guideway columns that are similar in appearance to those supporting the West Seattle Bridge. The cable-stayed bridge over the West Waterway would be supported by cables attached to two guideway columns, the tops of which would be approximately 400 feet above the waters of the navigation channel and 130 feet above the deck of the bridge (represented in KOP WS-2 and KOP WS-6). The support cables of this bridge would create an inverted "v." Due to its height and vivid appearance, the cable-stayed bridge is the most visually distinctive bridge being considered and would be seen over the greatest distance. The appearance of the truss bridge type over the West Waterway would be similar to the nearby lower BNSF truss bridge but would be at a much larger scale and more visually distinctive from a greater distance.

The types of bridges and their different visual characteristics would have different influences on the visual character of views toward the West Seattle Bridge from sensitive viewers in the Riverside community or in nearby parks (represented by KOP WS-3 and KOP WS-4). However, regardless of bridge type, the alternatives would not impact the visual quality for these sensitive viewers. The visual quality of views toward the West Seattle Bridge is already low, and the presence of an elevated guideway would not change the low visual quality.

Another concentration of sensitive viewers is on the top of Pigeon Point (represented in KOP WS-9). Preferred Alternative DUW-1a would pass by a residential area at the north end of Pigeon Point (along Southwest Charlestown Street and 19th Avenue Southwest, 20th Avenue Southwest, and 21st Avenue Southwest) that is bordered by the West Duwamish Greenbelt. Tree removal in the greenbelt would open up views to the north toward Elliott Bay. This and the removal of residences next to the greenbelt would be noticed by remaining residents *(*see Figure 2-9b in Attachment N.2A*)*. However, the remaining residences would be too far back from the greenbelt to see the industrial lands to the north that the trees in the greenbelt currently screen. None of the project components (elevated guideways, overhead catenary system, or trains) associated with this alternative would be seen from remaining residences. The residential character of views to the north from remaining residences would remain transportation or change from transportation to unbuilt lot with the removal of residences. Sound Transit would use the lots where residences would be removed for the construction of the guideway. This alternative would reduce the high visual quality of views to the north from remaining residences to high average, which would not be a visual impact.

A third area with sensitive viewers along the Preferred Alternative DUW-1a alignment is on the northwestern slope of Pigeon Point along 21st Avenue Southwest, 22nd Avenue Southwest, and 23rd Avenue Southwest. In this area, this alternative would change visual character and impact visual quality of views from some residences along these streets (represented by KOP WS-10). Removing trees would result in uninterrupted views of industrial and commercial areas below as well as the West Seattle Bridge and other streets from some residences. This would change the current residential and natural character of the views to industrial-commercial and bridge. In addition, components of this alternative would be seen, depending on location. The existing average to high visual quality of views to the northwest from this area would be reduced to low, which would be an impact to visual quality.

There are no trails within the portion of the West Duwamish Greenbelt that Preferred Alternative DUW-1a would pass through. There is a pedestrian passageway consisting of series of sections of paved walkway and stairs between Southwest Charleston Street and Southwest Marginal Way that allows pedestrians to walk between Pigeon Point and West Marginal Way Southwest. This alternative would pass over this series of paved walkways and stairs and would be seen by pedestrians. People using the passageway are generally using it for transportation rather than recreation and are not considered sensitive viewers in this analysis. The elevated guideway would add another large-scale elevated transportation element (in addition to the West Seattle Bridge) to views along the passageway and would not change the visual character of quality of most areas along the guideway.

City of Seattle Designated Scenic Routes and Public View Protection

East Marginal Way South, State Route 99, the Spokane Street Bridge, and the West Seattle Bridge (including the West Seattle Bridge Trail) are City of Seattle Designated Scenic Routes. There are no views of elements identified as protected by the City (such as the Olympic Mountains, the Cascade Mountains, Mount Rainier, Puget Sound, Elliott Bay, and the downtown skyline) from the stretch of East Marginal Way South where Preferred Alternative DUW-1a would be visible. The nearby presence of the Preferred Alternative DUW-1a elevated guideway in the foreground of the view from East Marginal Way South looking directly south would be another layer of the human-made elements (overpasses) that characterize the existing view conditions. Views to the south from the West Seattle Bridge would be altered by the presence of the elevated guideways associated with Preferred Alternative DUW-1a (represented by KOP WS-2). This alternative would be approximately 115 feet south (over the center of the Duwamish Waterway) of the West Seattle Bridge and, in some locations, would block travelers' passing views of the Duwamish Waterway and Mount Rainier (see Figure 2-2b

in Attachment N.2A*).* Sound Transit is considering either a truss or a cable-stayed bridge for the West Waterway crossing for Preferred Alternative DUW-1a. Both truss or cable-stayed bridges could be less bulky than the balanced cantilever segmental box girder considered for other alternatives in terms of scale and form. However, they would still intrude upon, or disrupt, the views described above.

Cables from the cable-stayed and vertical steel members of the truss bridge types would be seen by people passing them on the West Seattle Bridge (but would not block views), and the tall guideway columns of both types of bridges would momentarily block north or south views. The many vertical support arms of the truss bridge would slightly intrude upon views from the West Seattle Bridge as drivers and trail users approach and pass over the Duwamish Waterway more than the cable-stayed type of bridge.

The balanced cantilever segmental box girder bridge for the crossing of the East Waterway would be narrower in width than the cable-stayed or the truss on the West Waterway. The bridge would be very similar to the existing West Seattle Bridge in scale, form, materials, and overall appearance. Its bridge deck would be supported by a series of guideway columns that are similar in appearance to those supporting the West Seattle Bridge.

No additional City of Seattle protected views would be affected by Preferred Alternative DUW-1a.

Light, Glare, and Shadows

As is the case with vehicles currently traveling on the West Seattle Bridge, lights and glare (from reflective surface materials) from passing trains associated with Preferred Alternative DUW-1a would be seen from nearby areas. Lights from trains would be seen from the Riverside and the northwestern slope of Pigeon Point residential areas, and from the West Duwamish Greenbelt, Harbor Marina Corporate Center at Terminal 102, and t̓uʔəlaltxʷ Village Park and Shoreline Habitat. The lights from trains would add additional lights to the variety of lights seen throughout the Duwamish Segment. Light and glare produced by trains would not affect motorists, pedestrians, or the surrounding area. Safety lights for aviation could be required on the bridges being considered for crossing the Duwamish Waterway. These lights could be required at the tops of bridge towers, guideway columns, or the bridge's tallest point. These lights would be seen at night and be similar in appearance to other aviation safety lights, such as those on the tops of communication towers and buildings. Navigation lights could be required on the guideway column protection system and the base of the bridge deck. These lights would be similar to navigation lights seen on bridges over the Duwamish Waterway. The bridge and elevated guideway would add to the existing shadows associated with the West Seattle Bridge, including shadows on public open spaces such as the West Duwamish Greenbelt and Terminal 18 Park (only when winter sun angles are low).

4.2.2.2 South Crossing South Edge Crossing Alignment Option (DUW-1b)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Option DUW-1b would be similar to Preferred Alternative DUW-1a except it would cross the East Waterway on the south edge of Harbor Island and is shown as a balanced cantilevered segmental box girder bridge. Option DUW-1b would not pass by areas with concentrations of sensitive viewers until crossing the south end of Harbor Island above Harbor Marina Corporate Center at Terminal 102. It would continue west across the Duwamish Waterway and approach Pigeon Point from the southeast and follow the alignment of Preferred Alternative DUW-1a. The portions of Option DUW-1b that would pass near areas with concentrations of sensitive viewers would be very similar to that of Preferred Alternative DUW-1a and would have the same influence on visual quality, protected views, and light, glare, and shadows (see Figure 2-3d in Attachment N.2A). This option would be approximately 400 feet farther south of Preferred Alternative DUW-1a when

it would cross the Duwamish Waterway. The elevated guideway of this Option DUW-1b would pass above the southern portion of Harbor Marina Corporate Center at Terminal 102, and guideway columns would be placed within or near it (represented by KOP WS-3). The presence of the bridge and guideway columns would not further reduce the low visual quality of views from within Harbor Marina Corporate Center at Terminal 102. The portion of Option DUW-1b in the Pigeon Point community would be the same as Preferred Alternative DUW-1a and have similar visual impacts from nearby Riverside area residences (represented in KOP WS-7).

City of Seattle Designated Scenic Routes and Public View Protection

East Marginal Way South is a City of Seattle Designated Scenic Route. However, there are no views of elements identified as protected by the City (such as the Olympic Mountains, the Cascade Mountains, Mount Rainier, or Duwamish Waterway) from the stretch of East Marginal Way South where Option DUW-1b would be visible. The nearby presence of the elevated guideway of Option DUW-1b in the foreground of the view from East Marginal Way South looking directly south would be another layer of the human-made elements (overpasses) that characterizes the existing view conditions.

State Route 99, the Spokane Street Bridge, and the West Seattle Bridge (including the West Seattle Bridge Trail) are also City of Seattle Designated Scenic Routes. At Harbor Island, Option DUW-1b would be over 400 feet farther south from the West Seattle Bridge than Preferred Alternative DUW-1a and would intrude to a lesser degree on travelers' views of key features, such as Mount Rainier and the Duwamish Waterway (see Figure 2-3d in Attachment N.2A). As discussed for Preferred Alternative DUW-1a, no additional City of Seattle protected views would be affected by Option DUW-1b.

Light, Glare, and Shadows

Option DUW-1b would have a similar influence on light, glare, and shadows as Preferred Alternative DUW-1a, although unlike that alternative, the shadow from the elevated guideway would be cast on parts of one additional open space used by the public (Harbor Marina Corporate Center at Terminal 102) at the south end of Harbor Island.

4.2.2.3 North Crossing Alternative (DUW-2)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative DUW-2 would continue south from South Forest Street along the west side of the existing rail line on an elevated guideway before heading west on a new fixed, light-rail-only bridge north of the existing West Seattle Bridge (represented in KOP WS-5). The height of the guideway would range between approximately 30 feet and 170 feet high. It would be at its highest when crossing the West Waterway. Alternative DUW-2 would parallel the north side of the West Seattle Bridge past the western shoreline of the Duwamish Waterway, pass through industrial areas north and northwest of the bridge, (represented in KOP WS-1) and turn south toward the edge of Delridge Way Southwest and the boundary of this segment.

Alternative DUW-2 would have the least change to visual character and least impact on visual quality of the Duwamish Segment alternatives. It would pass by one area containing concentrations of sensitive viewers, Terminal 18 Park. This alternative would introduce another large-scale overhead structure (in addition to the West Seattle Bridge) to views to the south from Terminal 18 Park. This alternative would not change the existing maritime transportation-oriented visual character of views from Terminal 18 Park or further reduce the visual quality of views from this park. This alternative would be seen to the north behind the West Seattle Bridge by residents in the Riverside neighborhood along 17th Avenue Southwest and 18th Avenue Southwest and would not further reduce the existing low visual quality of views towards it (see Figure 2-7d in Attachment N.2A).

Trains would be visible in the distance between existing vegetation (that would not be removed) in the West Duwamish Greenbelt from residences along Southwest Charlestown Street and 19th Avenue Southwest, 20th Avenue Southwest, and 21st Avenue Southwest (see Figure 2-4c in Attachment N.2A). Although trains would be visible, this would not change the residential visual character or lower the existing high visual quality in this area.

Alternative DUW-2 would not remove trees along the northwestern slope of Pigeon Point within the West Duwamish Greenbelt and would not change the existing visual character or lower visual quality of views from residences along 21st Avenue Southwest, 22nd Avenue Southwest, and 23rd Avenue Southwest.

City of Seattle Designated Scenic Routes and Public View Protection

East Marginal Way South and State Route 99 are City of Seattle Designated Scenic Routes. There are no views of elements identified as protected by the City (such as the Olympic Mountains, the Cascade Mountains, Mount Rainier, Puget Sound, Elliott Bay, and the downtown skyline) from the stretch of East Marginal Way South and State Route 99 where Alternative DUW-2 would be visible. The nearby presence of the Alternative DUW-2 elevated guideway in the foreground of the view from East Marginal Way South and State Route 99 looking directly south would be another layer of the human-made elements (overpasses) that characterize the existing view conditions.

Alternative DUW-2 would pass approximately 350 feet north of the West Seattle Bridge. The elevated guideway would alter or block short segments of views to the north for people traveling on the West Seattle Bridge. The elevated guideway would intrude on views of features such as Elliott Bay, Puget Sound, and the downtown skyline (see Figure 2-8b in Attachment N.2A).

Sound Transit is considering the possibility of a truss or a cable-stayed bridge for this crossing rather that the balanced cantilever segmental box girder bridge that was depicted in Attachment N.2A for this alternative and others that were simulated. Both truss or cable-stayed bridges would be less bulky in terms of scale and form than the bridges that were depicted in the simulations. They would still intrude upon, or block, the views described above but to a lesser degree. No additional City of Seattle protected views would be affected by this alternative.

Light, Glare, and Shadows

The influence of light, glare, and shadows produced by Alternative DUW-2 would be similar to that described for Preferred Alternative DUW-1a but would not be seen from the same areas with concentrations of sensitive viewers. Lights from this alternative would be seen in front of the West Seattle Bridge from Terminal 18 Park. Shadows created by the elevated guideway would be cast on Terminal 18 Park and Bridge Gear Park for short periods of time in the mornings and winter when the sun angle would be low.

4.2.3 Delridge Segment

Table 4-3 identifies locations within the Delridge Segment where there would be visual impacts (a reduction of one or more visual quality categories) near areas with concentrations of sensitive viewers. The Delridge Segment would have primarily above-ground components and contains nearby concentrations of sensitive viewers. Simulations developed for the Delridge Segment in Attachment N.2A serve as a guide to understand how visual quality would change with the alternative from clear vantage points. Cross sections and 3D views are provided in Attachment N.2B to illustrate the general height, bulk, and scale of the Delridge Station. For more information about station design, see the Sound Transit Station Area Development Opportunities Memo (Sound Transit in development). Because the station and alignments in Delridge represent a

noticeable visual change, a 3D model was created to compare the following components of the alternatives: heights and locations of alignments, station heights, bulk of station elements, and scale relative to the surrounding buildings and landscape (Figure 4-3).

Table 4-3. Delridge Segment Visual Quality Impacts near Concentrations of Sensitive Viewers

Alternative or Design Option	Visual Impacts (miles) [a]	Where Visual Impacts Would Occur
Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	**0.1**	**Residences along 32nd Avenue Southwest**
Dakota Street Station Alternative (DEL-1a)	1.0	Residences along 23rd Avenue Southwest, 25th Avenue Southwest, 26th Avenue Southwest, Nevada Street, Delridge Way Southwest, and parts of Southwest Genesee Street and part of the Delridge Playfield, West Seattle Golf Course, and some locations within Longfellow Creek Natural Area
Dakota Street Station North Alignment Option (DEL-1b)	1.0	Similar to Preferred Alternative DEL-1a; however, additional residences north of Southwest Genesee Street would be removed and therefore do not have visual impacts
Dakota Street Station Lower Height Alternative (DEL-2a)	1.0	Similar to Preferred Alternative DEL-1a but would impact views from fewer residences
Dakota Street Station Lower Height North Alignment Option (DEL-2b)	1.0	Similar to Preferred Alternative DEL-1a; however, additional residences north of Southwest Genesee Street would be removed and therefore do not have visual impacts
Delridge Way Station Alternative (DEL-3)	1.0	Similar to Preferred Alternative DEL-1a
Delridge Way Station Lower Height Alternative (DEL-4)	1.0	Similar to Preferred Alternative DEL-1a
Andover Street Station Alternative (DEL-5)	0.2	Residences along Southwest Avalon Way between Southwest Yancy Street and Southwest Genesee Street
Andover Street Station Lower Height (DEL-6a)	0.1	Residences along a small section of 32nd Avenue Southwest
Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)	0.1	Residences along 32nd Avenue Southwest

[a] Visual impacts occur when an existing visual quality category (high, average, or low) is reduced one or more categories. Visual impacts are in miles along the length of the alternative or option adjacent to concentrations of sensitive viewers.

The West Seattle Link Extension Minimum Operable Segment (M.O.S.) would have an interim terminus in Delridge. With the M.O.S., a tail track (which would look the same as the guideway for the full-length alternatives) would extend approximately 500 feet southwest of Delridge Station. The M.O.S. would have the same design of the guideway and Delridge Station, and therefore would not result in different visual impacts than the full-length alternatives discussed for the Delridge Segment and is not discussed further in this technical report.

Figure 4-3. Delridge Segment Alternatives 3D Model

4.2.3.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Preferred Option DEL-6b includes an elevated guideway on the west side of Delridge Way Southwest near Southwest Andover Street would be seen by residential sensitive viewers east of Delridge Way Southwest (represented in KOP WS-11) see Figure 3-1b in Attachment N2.A). The height of the guideway would range from approximately 40 feet to 80 feet high and the top of the station would be approximately 70 feet. The height, bulk, and scale of the station would be consistent with the existing commercial and industrial development at the intersection of Southwest Andover Street and Delridge Way Southwest.

The alignment would travel west along Southwest Andover Street, curving to the southwest past commercial areas and entering the residential neighborhood between Southwest Andover Street and the north side of Southwest Yancy Street. The elevated guideway would be seen primarily by residential sensitive viewers along 26th Avenue Southwest looking north (represented by KOP WS-14) The guideway would also be seen by sensitive viewers near the Longfellow Creek Legacy Trailhead on Southwest Yancy Street and by park users at Longfellow Creek Natural Area near 28th Avenue Southwest before crossing over Southwest Avalon Way with an elevated guideway (represented by KOP WS-16 and KOP WS-17) The visual quality from these two recreation resources would decrease from average to low average due to the scale and proximity of the structures to the sensitive viewers. Preferred Option DEL-6b would cross 32nd Avenue Southwest at-grade and then transition to a retained-cut condition, resulting in the closure of a portion of 32nd Avenue Southwest and removal of residences (represented by KOP WS-22 and KOP WS-25) This closure would be seen from the remaining residences along 32nd Avenue Southwest, and the visual quality would be reduced from high average to low.

The Delridge station would be elevated north of Southwest Andover Street and west of Delridge Way Southwest, in a northeast-southwest orientation. The top of the station structure would be approximately 70 feet high and would be seen by the residential sensitive viewers east of Delridge Way Southwest near Southwest Andover Street (represented in KOP WS-11). The existing average visual quality of views to the station from the residences would slightly increase to high average due to the visual coherence the station and guideway would provide.

City of Seattle Designated Scenic Routes and Public View Protection

Preferred Option DEL-6b is located adjacent to Fauntleroy Way Southwest on the west end of the Delridge Segment. The alignment transitions to a retained cut, and ancillary components such as catenary poles would be noticed by travelers for a brief period. Due to the depth of the alignment's retained-cut condition, the exposure from travelers on Fauntleroy Way Southwest to residential buildings along 32nd Avenue Southwest would increase compared to the current conditions. From the remaining residence along the south end of 32nd Avenue Southwest the alignment and the ancillary components would be noticed and partially obscure views to the downtown skyline. This alternative would have an effect on City of Seattle protected views.

Light, Glare, and Shadows

With Preferred Option DEL-6b, lights from passing trains on the elevated guideway would be seen by residents from the multi-story residential buildings that line the adjacent parts of Southwest Yancy Street and 32nd Avenue Southwest. The lights from the trains would add to the at-grade lights from vehicles traveling on Southwest Yancy Street and 32nd Avenue

Southwest, where the alignment transitions from elevated to at-grade to retained-cut profile. The removal of trees next to the West Seattle Bridge on-ramp would eliminate the screening value of the trees for screening lights from vehicles traveling on the on-ramp. Shadows from the elevated guideway would not be cast on the Longfellow Creek Natural Area and other open spaces used by the public due to its location and height.

4.2.3.2 Dakota Street Station Alternative (DEL-1a)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative DEL-1a would follow Delridge Way Southwest south on an elevated guideway to an elevated station. The guideway would be on the west side of Delridge Way Southwest except for in the vicinity of Southwest Andover Street, where it would be in the roadway right-of-way. The height of Alternative DEL-1a components would range between approximately 70 feet and 150 feet. The height of the top of the Delridge Station with this alternative would be approximately 110 feet. The alternative's elevated guideway would follow Delridge Way Southwest and cross over it near Southwest Dakota Street (see Figure 3-2b in Attachment N.2A). This alternative would require the removal of some single-family residences along Delridge Way Southwest south of Southwest Andover Street, as well as the removal of most of the residences in the blocks between Delridge Way Southwest on the east, Southwest Genesee Street on the south, 26th Avenue Southwest on the west, and Southwest Dakota Street on the north. The curve of the alignment would not follow the street grid of this area, which would be inconsistent with the existing street pattern and would disrupt the visual coherence.

With Alternative DEL-1a, the height of the elevated Delridge Station (about 110 feet) would be taller than the current 30- to 35-foot height allowed by zoning. By removing the residences and introducing the elevated guideway and station into this area, the current residential character of views from remaining nearby residences and the Delridge Playfield (represented in KOP WS-13) would change to a transportation character, and these new transportation elements would seem visually out of place. The elevated station and guideway would be noticeably higher and be larger in bulk and scale than any other structures in this area, and the station would have a more contemporary design than many older nearby residential single-family buildings in the area. The new station design would be similar to that of the many newer multi-family developments that are increasingly being built in the area (particularly along Delridge Way Southwest). The elevated station and guideway would reduce the current average degree of visual unity and intactness of views toward them to low. These reductions would result in a lowering of the current average visual quality to low, which would be a visual impact.

Southeast of the Delridge Station, Alternative DEL-1a would gradually curve toward Southwest Genesee Street past the Delridge Playfield (see Figure 3-3b in Attachment N.2A) and follow the south side of Southwest Genesee Street next to the West Seattle Golf Course up the hill to Southwest Avalon Way (see Figure 3-5a in Attachment N.2A). The elevated guideway would be as high as approximately 150 feet above-grade along this section of the alignment. Trees along both sides of Southwest Genesee Street and within the northern edge of the West Seattle Golf Course would be removed (see Figure 3-5b in Attachment N.2A), as would residences north of Southwest Genesee Street.

Some vegetation would be removed from the south edge of the Longfellow Creek Natural Area. Remaining trees would screen or partially screen views of the elevated guideway from most of the Longfellow Creek Legacy Trail, which follows the creek along the bottom of its ravine. In the few areas along the trail where the elevated guideway would be seen), the high average visual quality of views would be reduced to low, which would be a visual impact.

The removal of the trees, residences, and other visual elements in the Delridge Segment, as well as the elevated guideway, would be seen by sensitive viewers in the Delridge Playfield (represented in KOP WS-13), the West Seattle Golf Course (represented in KOP WS-20), and remaining residences north of the residences adjacent to Southwest Genesee Street (represented in KOP WS-15) that were removed. The existing high visual quality of views toward the guideway from the Delridge Playfield and West Seattle Golf Course would be reduced to low average, which would be a visual impact. The generally high average visual quality of views from the residences north of Southwest Genesee Street (represented in KOP WS-15) toward the guideway would be reduced to low, which would also be an impact to visual quality. Note that the impact assessment in Attachment N.2A describes that Alternative DEL-1a would not impact the visual quality of views looking down the length of Southwest Genesee Street from two KOPs (represented by KOP WS-15 and KOP WS-21) at either end of the street. This conclusion would not apply to perpendicular views toward the guideway from remaining residences to the north of the residences adjacent to Southwest Genesee Street that would remain. Where the alternative would cross over the Southwest Genesee Street and Southwest Avalon Way intersection, it would introduce a new large-scale transportation element to an area whose character is a mix of residential and transportation arterial intersection (see Figure 3-14b in Attachment N.2A). The elevated guideway and columns would be dominant visual components to the view but would not block street-level views of the downtown skyline. The average visual quality of the views near this intersection would be reduced to low average, which would not be a visual impact.

City of Seattle Designated Scenic Routes and Public View Protection

There are no City of Seattle Designated Scenic Routes near Alternative DEL-1a. The alternative would intrude upon or block views of the Downtown Seattle skyline from parts of the West Seattle Golf Course (see Figure 3-10b in Attachment N.2A). Views of the Olympic Mountains, the Cascade Mountains, Mount Rainier, Puget Sound, Elliott Bay, or the downtown skyline from the other City of Seattle protected view, the West Seattle Rotary Viewpoint would not be blocked by Alternative DEL-1a (which is located above and over 0.25 mile to the east of the West Seattle Rotary Viewpoint).

Light, Glare, and Shadows

With Alternative DEL-1a, lights, and to a much lesser degree, glare from passing trains on the elevated guideway as well as the elevated station lights would be seen from nearby, including areas with concentrations of sensitive viewers. At night, trains would be quite visible, particularly between Delridge Way Southwest and Southwest Avalon Way. The elevated guideway would cast shadows on the north end of the West Seattle Golf Course and the southern edge (adjacent to Southwest Genesee Street) of the Longfellow Creek Natural Area.

4.2.3.3 Dakota Street Station North Alignment Option (DEL-1b)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Option DEL-1b would be similar to Alternative DEL-1a except it would be within the Southwest Genesee Street right-of-way between the West Seattle Golf Course and the Longfellow Creek Natural Area, then shift to the north side of Southwest Genesee Street west of 28th Avenue Southwest. The height of Option DEL-1b components would range between approximately 60 feet and 150 feet. The height to the top of the Delridge Station for Option DEL-1b would be approximately 110 feet. Up to the east end of the West Seattle Golf Course, the impacts associated with Option DEL-1b would be essentially the same as those described for Alternative DEL-1a (see Figure 3-2c in Attachment N.2A) for a view of this alternative along Delridge Way Southwest). Shortly after leaving the station, the elevated guideway would cross

to the south side of Southwest Genesee Street and then veer back along and over the center of the street and onto the north side for the rest of the route in this segment. Some vegetation would be removed from the southern edge of the Longfellow Creek Natural Area. Remaining trees would screen or partially screen views of the elevated guideway from most of the Longfellow Creek Legacy Trail, which follows the creek along the bottom of its ravine. In the few areas along the trail where the elevated guideway would be seen, the high average visual quality of views would be reduced to low, which would be a visual impact.

Option DEL-1b, unlike Alternative DEL-1a, would require removing all of the residences on the north side of Southwest Genesee Street and many of the trees that line the south side of the street as well as trees within the northern edge of the West Seattle Golf Course. It would remove fewer trees along the south side of Southwest Genesee Street and the northern edge of the West Seattle Golf Course than would be removed with Alternative DEL-1a. The changes to the appearance of Southwest Genesee Street and the presence of the elevated guideway, which would be higher (approximately 150 feet at its highest point along Southwest Genesee Street) and have a larger bulk and scale than nearby structures, would be seen from the remaining nearby residences north of the residences that would be removed, as well as by recreationists using the West Seattle Golf Course (see Figures 3-11b and 3-10c in Attachment N.2A). The visual quality of views from the remaining residences towards the guideway (represented in KOPs WS-15 and WS-21) would be reduced from high average to low, which would be a visual impact. The existing high visual quality of views toward the guideway from the Delridge Playfield and West Seattle Golf Course (represented in KOPs WS-13 and WS-20) would be reduced to low average, which would be a visual impact. The Southwest Avalon Way and Southwest Genesee Street intersection crossing would appear very similar in appearance to Alternative DEL-1a and would also not be considered a visual impact (see Figure 3-14c in Attachment N.2A).

City of Seattle Designated Scenic Routes and Public View Protection

There are no City of Seattle Designated Scenic Routes near Option DEL-1b. Option DEL-1b would have similar impacts on protected views as Alternative DEL-1a.

Light, Glare, and Shadows

The influence of Option DEL-1b on light, glare, and shadows would be very similar to what was described above for Alternative DEL-1a.

4.2.3.4 Dakota Street Station Lower Height Alternative (DEL-2a)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

From the beginning of the Delridge Segment to the east end of the West Seattle Golf Course, the Alternative DEL-2a would be similar to Alternative DEL-1a, although it would be lower in height (see Figure 3-2d in Attachment N.2A). Alternative DEL-2a would travel over and south of Southwest Genesee Street through the north end of the West Seattle Golf Course, where it would enter a tunnel. The maximum height of the elevated guideway would be about 60 feet, and the height to the top of the Delridge Station would be approximately 60 feet, with the platform at 35 feet high. With this alternative, the Delridge station would be approximately 50 feet lower than the station for Alternative DEL-1a.

The elevated station would be taller than the current 30- to 35-foot height allowed by zoning. The influence of this lower station on visual character would be very similar to that described for Alternative DEL-1a, but because the top of the station in Alternative DEL-2a station would be about 50 feet lower, it would be seen from fewer areas and therefore would change the visual

character of less of the area than would Alternative DEL-1a. Alternative DEL-2a's impact to visual quality would be the same as that of Alternative DEL-1a. The elevated station and guideway's height, bulk, and scale would reduce the current average degree of visual unity and intactness of views towards it to low. These reductions would result in a lowering of the current average visual quality to low, which would be a visual impact.

By removing the residences and introducing the elevated guideway and station, the current residential character of views towards this area from remaining nearby residences would change to transportation. The elevated station and guideway would be noticeably higher and have a larger bulk and scale than nearby structures and would lack visual coherence with the street grid due to the curved alignment. The station would also have a more contemporary design than many older nearby residential single-family buildings. The station design, height, bulk, and scale would be similar to that of the many newer multi-family developments that are increasingly being built in the area (particularly along Delridge Way Southwest). The elevated station and guideway would reduce the current average degree of visual unity and intactness of views towards it to low. These reductions would result in a lowering of the current average visual quality to low, which would be a visual impact.

Alternative DEL-2a would remove some trees along the edge of Southwest Genesee Street on private property. Trees would screen or partially screen views of the elevated guideways along most of the Longfellow Creek Legacy Trail. The elevated guideway would be seen from some locations along the trail, but its presence would not lower visual quality of views along the trail.

From Southwest Genesee Street, Alternative DEL-2a would remove one residence north of Southwest Genesee Street. It would pass through the northern portion of the West Seattle Golf Course to a portal at the west end of the golf course. The guideway would extend farther south into the West Seattle Golf Course than would Alternative DEL-1a. The presence of Alternative DEL-2a would change the recreational visual character of views toward it from within the golf course (represented in KOP WS-20) and the residential character of views along the north side of Southwest Genesee Street to transportation (represented in KOPs WS-15 and WS-21). Potential sound walls along the eastern portion of Southwest Genesee Street would be on the elevated guideway and would not be very different in appearance from the guideway structure. Freestanding sound walls would be on the west end of Genesee right before the alignment enters into a tunnel. In this area, the sound walls would be noticeable and more memorable than the existing view. The change would not be enough to change the vividness rating. The sound wall near the tunnel portal would contrast with the existing view in terms of height, bulk, and scale, and would be an encroachment into the view. The removal of trees and presence of this alternative through the north end of the West Seattle Golf Course would lower the existing high unity and intactness of views in this area. It would reduce the high visual quality of views from within the West Seattle Golf Course and the Delridge Playfield (represented in KOPs WS-20 and WS-13, respectively) to low average, which would be a visual impact. This alternative would also reduce the high average visual quality of views from along both sides of Southwest Genesee Street to low average, which would not be a visual impact.

City of Seattle Designated Scenic Routes and Public View Protection

There are no City of Seattle Designated Scenic Routes near Alternative DEL-2a. This alternative would have similar impacts on protected views as Alternative DEL-1a.

Light, Glare, and Shadows

The influence of Alternative DEL-2a on light, glare, and shadows would be similar to what was described for Alternative DEL-1a, although passing trains and the station would be lower in height in many areas, particularly at the elevated Delridge Station. The elevated guideway

would cast shadows on parts of two open spaces used by the public—the north end of the West Seattle Golf Course and along the southern edge (adjacent to Southwest Genesee Street) of the Longfellow Creek Natural Area.

4.2.3.5 Dakota Street Station Lower Height North Alignment Option (DEL-2b)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Up to the east end of the West Seattle Golf Course, the impacts associated with Option DEL-2b would be essentially the same as those described for Alternative DEL-2a, except it would shift to the north side of Southwest Genesee Street west of 28th Avenue Southwest. With Option DEL-2b, the alternative and associated impacts to visual quality near areas with concentrations of sensitive viewers would be very similar to those associated with Option DEL-1b. Option DEL-2b's Delridge Station would also be approximately 60 feet high and would have similar height and scale influences on the visual character and quality of views toward it from remaining residences. Residences north of Southwest Genesee Street would be removed. Compared to Option DEL-1b, Option DEL-2b would not require the removal of as many trees along the south side of Southwest Genesee Street (represented by KOP WS-15). This would result in slightly less of an impact on the visual quality of views within the West Seattle Golf Course. With Option DEL-2b, the existing high visual quality of views from the West Seattle Golf Course (represented in KOP WS-20) would be reduced to average. This design option would still have a visual impact on views toward it from the West Seattle Golf Course as well as from remaining residences north of Southwest Genesee Street. Potential sound walls along the eastern portion of Southwest Genesee Street would be on the elevated guideway and would not be very different in appearance than the guideway structure. Freestanding sound walls would be on the west end of Southwest Genesee Street right before the alignment enters into a tunnel. In this area, the sound walls would be noticeable and more memorable than the existing view, but vegetation would act as a visual buffer. The change would not be enough to change the vividness rating. The sound wall near the tunnel portal would contrast with the existing view in terms of height, bulk, and scale, and would be an encroachment into the view, but not enough to reduce the visual quality to create a visual impact.

Option DEL-2b would remove some vegetation along the edge of the Longfellow Creek Natural Area. Although trees within the Longfellow Creek Natural Area would generally screen views of the elevated guideway, people on the Longfellow Creek Legacy Trail would see the elevated guideway from some locations. The presence of the elevated guideway would not lower the visual quality of views along the trail.

City of Seattle Designated Scenic Routes and Protected Views

There are no City of Seattle Designated Scenic Routes near Option DEL-2b. This design option would somewhat intrude upon views of the downtown skyline from parts of the West Seattle Golf Course (see Figure 3-10e in Attachment N.2A). It would not intrude upon or block views of the Olympic Mountains, the Cascade Mountains, Mount Rainier, Puget Sound, or Elliott Bay. Views of Option DEL-2b would be blocked from the other City of Seattle protected view, the West Seattle Rotary Viewpoint.

Light, Glare, and Shadows

The influence of Option DEL-2b on light, glare, and shadows would be similar to that described for Alternative DEL-2a, although there would be less shadow on the West Seattle Golf Course because the west end of Option DEL-2b would be on the opposite side of Southwest Genesee Street.

4.2.3.6 Delridge Way Station Alternative (DEL-3)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative DEL-3 would follow Delridge Way Southwest south on an elevated guideway to the Delridge Station. The station would be in the middle of Delridge Way Southwest, north of Southwest Dakota Street. The height of the Alternative DEL-3 elevated guideway would range between about 50 feet and 150 feet, and the height to the top of the Delridge Station would be approximately 90 feet with a platform height of 65 feet. The elevated station and guideway would be noticeably higher and have a larger bulk and scale than nearby structures. This alternative would pass through the middle of residential blocks east of Delridge Way Southwest. It would require the removal of residences and trees, which would open up views to the west from remaining residences that are currently screened by trees and buildings. This would change the visual character of views from remaining residences on the hillside between the east side of Delridge Way Southwest and 23rd Avenue Southwest. The new views would include commercial and industrial areas, the elevated guideway, and the Delridge Station, which would cross over the middle of Delridge Way Southwest. The removal of trees and buildings and the presence of the alternative's components would decrease the average visual unity and intactness of views to the west from remaining residences along 23rd Avenue Southwest. This would reduce the average visual quality of views toward Alternative DEL-3 to low, which would be a visual impact.

Alternative DEL-3 would continue south along Delridge Way Southwest and follow it farther south than the other Delridge Segment Build Alternatives before veering west (see Figure 3-2e in Attachment N.2A*)* mid-block through the residential area south of Southwest Dakota Street between Delridge Way Southwest and 26th Avenue Southwest. The elevated guideway in this area would change the residential character of the areas it would pass through to transportation. The height, bulk, and scale of the elevated guideway would lower the generally average visual quality of views from remaining residences (represented in KOP WS-11) towards it to low, which would be a visual impact.

Alternative DEL-3 would not remove vegetation from the edge of the Longfellow Creek Natural Area, although it might be seen from a few points along the Longfellow Creek Legacy Trail due to its height. Where seen, it would lower the high visual quality of views toward the guideway to average, which would be a visual impact.

The guideway would pass along the south side of Southwest Genesee Street and would remove residences north of Southwest Genesee Street. It would also remove trees along the south side of this street (see Figures 3-3d, 3-5f, and 3-10b in Attachment N.2A) From the West Seattle Golf Course, Delridge Playfield, and Southwest Genesee Street, its appearance would be similar to that of Alternative DEL-1a, and impacts would be similar. The existing high visual quality of views toward the guideway from the Delridge Playfield and West Seattle Golf Course (represented in KOPs WS-13 and KOP WS-20) would be reduced to low average, which would be a visual impact. The generally high average visual quality of views from the residences north of Southwest Genesee Street toward the guideway would be reduced to low, which would also be an impact to visual quality.

City of Seattle Designated Scenic Routes and Protected Views

There are no City of Seattle Designated Scenic Routes near Alternative DEL-3. This alternative would have similar impacts on protected views as Alternative DEL-1a.

Light, Glare, and Shadows

With Alternative DEL-3, lights and, to a much lesser degree, glare from passing trains on the elevated guideway and the elevated Delridge Station lights would be seen from nearby, including areas with concentrations of sensitive viewers. At night, light rail trains would be quite visible, particularly in areas along both sides of Delridge Way Southwest where there are residences. The influence of this alternative on light, glare, and shadows in open spaces used by the public (the north end of the West Seattle Golf Course and the southern edge of the Longfellow Creek Natural Area) would be similar to what was described for Alternative DEL-1a.

4.2.3.7 Delridge Way Station Lower Height (DEL-4)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative DEL-4 would follow the same alignment as Alternative DEL-3 to the station but would be at a lower height to connect to tunnel alternatives in the West Seattle Junction Segment. With Alternative DEL-4, the height of the elevated guideway would range up to about 60 feet, and the height of the top of the Delridge Station would be approximately 90 feet. The elevated station and guideway would be noticeably higher and have a larger bulk and scale than nearby structures. Between the beginning of the Delridge Segment and Southwest Genesee Street (including the Delridge Station), Alternative DEL-4 would be similar to Alternative DEL-3, although the maximum height would be about 40 feet lower.

The influence of Alternative DEL-4 on visual quality near areas with concentrations of sensitive viewers near the Delridge Station and the residential neighborhood south of the station would be very similar to that described for Alternative DEL-3. Although it would be lower in height, Alternative DEL-4's influence on visual character and visual quality in the residential area east of Delridge Way Southwest would be very similar to that of Alternative DEL-3.

Alternative DEL-4 would not remove vegetation from the edge of the Longfellow Creek Natural Area, although it might be seen from a few points along the Longfellow Creek Legacy Trail. If and where it is seen, it would lower the high average visual quality of views toward the guideway to low average, which would not be a visual impact.

The impacts of Alternative DEL-4 on Delridge Playfield, residents along Southwest Genesee Street, and sensitive viewers in the golf course would be very similar to Alternative DEL-2a (see Figures 3-3c, and 3-3e in Attachment N.2A). Sound walls would be similar to those described for Alternative DEL-2a. The removal of trees and the presence of this alternative through the north end of the West Seattle Golf Course would lower the existing high unity and intactness of views in this area. It would reduce the high visual quality of views from within the West Seattle Golf Course and the Delridge Playfield (represented in KOPs WS-20 and WS-13, respectively) to low average, which would be a visual impact. Alternative DEL-4 would also reduce the high average visual quality of views from along both sides of Southwest Genesee Street (represented in KOPs WS-15 and WS-21) to low average, which would not be a visual impact.

City of Seattle Designated Scenic Routes and Public View Protection

There are no City of Seattle Designated Scenic Routes near Alternative DEL-4. This alternative would have similar impacts on protected views as Option DEL-2b.

Light, Glare, and Shadows

The influence of Alternative DEL-4 on light, glare, and shadows on open spaces would be similar to that described for Alternative DEL-1a, although passing trains and the station would be lower in height in many areas.

4.2.3.8 Andover Street Station Alternative (DEL-5)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative DEL-5 would be on an elevated guideway on the west side of Delridge Way Southwest, north of Southwest Andover Street, and would pass to the north of the alternatives previously described in the Delridge Segment. The height of the elevated guideway would range from about 50 to 130 feet, and the top of the Delridge Station would be approximately 90 feet in height. After crossing over Delridge Way Southwest (see Figure 3-2f in Attachment N.2A), Alternative DEL-5 would extend west along Southwest Andover Street near commercial and industrial areas to Southwest Yancy Street. From Southwest Yancy Street, the alternative would head south and enter a residential area. Although Alternative DEL-5 would have the second-least impact on the visual quality of views seen from areas with concentrations of sensitive viewers, it would have impacts along Southwest Avalon Way. This alternative would remove several multi-family residential buildings and most or all of the street trees along Southwest Avalon Way. The guideway curves to the west from Southwest Avalon Way would remove residential buildings (single-family and multi-family) along this street north of Southwest Genesee Street (see Figure 3-14e in Attachment N.2A).

Alternative DEL-5 would impact views from multi-family buildings along Southwest Avalon Way where buildings and existing street trees would be removed, and the elevated guideway would be seen along (and over) much of Southwest Avalon Way. The residential character of views along the street from residences would be changed to transportation. The height, bulk, and scale of the elevated guideway passing over Southwest Avalon Way through a corridor flanked with residences would reduce the average visual unity and intactness of views along it to low and reduce the average visual quality of views to low, which would be a visual impact.

City of Seattle Designated Scenic Routes and Protected Views

There are no City of Seattle Designated Scenic Routes near Alternative DEL-5. This alternative would not have on effect on City of Seattle protected views.

Light, Glare, and Shadows

With Alternative DEL-5, lights from passing trains on the elevated guideway would be seen by residents from the multi-story residential buildings that line this part of Southwest Andover Street. The lights from the trains would add to the at-grade lights from vehicles traveling on Southwest Andover Street. Shadows from the elevated guideway would be cast on Southwest Andover Street and adjacent properties, but not on the open spaces used by the public.

4.2.3.9 Andover Street Station Lower Height Alternative (DEL-6a)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative DEL-6a would be similar to Alternative DEL-5 up to and including the light rail station. After passing through commercial and industrial properties west of Delridge Way Southwest, Alternative DEL-6a would head west along Southwest Andover Street, pass into a residential area west of Southwest Andover Street, and then turn south through (and remove residences in) the residential area between 32nd Avenue Southwest and the ramp to and from the West Seattle Bridge (represented by KOP WS-11) The elevated guideway would range from ground level to about 120 feet. The station top height would be approximately 90 feet.

Alternative DEL-6a would have the least impact on visual quality of all the Delridge Segment alternatives. Just before Alternative DEL-6a would cross Southwest Yancy Street, it would remove a cluster of single-family residences. After crossing south of Southwest Yancy Street on

the north end of 32nd Avenue Southwest, this alternative would also remove a series of residences from the west (uphill) side of the street, adjacent to the West Seattle Bridge. Trees that currently screen views of the West Seattle Bridge would be left in place on the north end of 32nd Avenue Southwest. Where the residences and trees would be removed, the view toward the alignment from remaining residences (represented in KOP WS-25) would be changed from a residential character to transportation. The existing average visual quality of views to the west from these remaining residences would remain average.

Farther south along 32nd Avenue Southwest, trees would be removed that are currently behind some remaining residences on the west side of the street. The removal of trees would open up views to a portion of the West Seattle Bridge, the elevated guideway, and potential sound walls from the remaining residences along this portion of 32nd Avenue Southwest (represented by KOP WS-22). The average visual quality of views to the west from these residences would be reduced to low, which would be a visual impact.

City of Seattle Designated Scenic Routes and Public View Protection

With Alternative DEL-6a located adjacent to Fauntleroy Way Southwest on the west end of the Delridge Segment, the alignment transitions to at-grade and to a retained-cut condition. Ancillary components such as catenary poles would be noticed by travelers for a brief period; however, due to the depth of the alignment's retained-cut condition, the exposure to residential buildings along 32nd Avenue Southwest from travelers on Fauntleroy Way Southwest would increase compared current conditions. From the remaining residence along the south end of 32nd Avenue Southwest the alignment and the ancillary components would be noticed and partially obscure views to the downtown skyline. This alternative would have an effect on City of Seattle protected views.

Light, Glare, and Shadows

With Alternative DEL-6a, lights from passing trains on the elevated guideway would be seen by residents from the multi-story residential buildings that line this part of 32nd Avenue Southwest. The lights from the trains would add to the at-grade lights from vehicles traveling on 32nd Avenue Southwest. The removal of trees next to the West Seattle Bridge on-ramp would eliminate the screening value of the trees for screening lights from vehicles traveling on the on-ramp. Shadows from the elevated guideway would not be cast on open spaces used by the public.

4.2.3.10 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative DEL-7 would be similar to Preferred Option DEL-6b up to and including Delridge Station. The top of the Delridge Station structure would be approximately 70 feet high. The height of the guideway would range between approximately 40 feet and 80 feet. The height, bulk and scale of the station would be consistent with the existing commercial and industrial development at the intersection of Southwest Andover Street and Delridge Way Southwest. The elevated guideway would be seen primarily by residential sensitive viewers along 26th Avenue Southwest looking north (represented by KOP WS-14). The guideway would also be seen by sensitive viewers near the Longfellow Natural Area trailhead on Southwest Yancy Street (represented in KOP WS-16) and by park users at the Longfellow Creek Natural Area near 28th Avenue Southwest before it crosses over Southwest Avalon Way with an elevated guideway. The visual quality from these two recreation areas would decrease from average to low average due to the scale and proximity of the structures to the sensitive viewers.

South of the station, the elevated guideway would continue west along Southwest Yancy Street and cross over Southwest Avalon Way in an elevated guideway (see Figure 3-8d in Attachment N.2A) and would be seen by sensitive viewers in a similar way as described for Preferred Option DEL-6b. A tunnel portal leading to Alternative WSJ-6 in the West Seattle Junction Segment would be in the vicinity of 32nd Avenue Southwest, east of the West Seattle Bridge, and would be seen primarily by residential viewers in the vicinity of 32nd Avenue Southwest. 32nd Avenue Southwest would no longer connect to Southwest Andover Street but would end in a cul-de-sac south of the tunnel portal and would be seen by residential viewers on both the north and south side of the portal (represented in KOP WS-25) see Figure 3-12d in Attachment N.2A. The visual quality in this area would be reduced from high average to low. The tunnel portion would continue west under the West Seattle Bridge towards 35th Avenue Southwest and would result in visual impacts to sensitive viewers.

City of Seattle Designated Scenic Routes and Public View Protection

Alternative DEL-7 would not be seen from City of Seattle Designated Scenic Routes. The alignment remains aerial up to the east side of the West Seattle Bridge, where it transitions to a tunnel condition. The portal or aerial structure would not be seen from the West Seattle Bridge. This alternative would not have an effect on City of Seattle protected views.

Light, Glare, and Shadows

With Alternative DEL-7, lights from passing trains on the elevated guideway would be seen by residents from the multi-story residential buildings that line this part of Southwest Yancy Street and 32nd Avenue Southwest. The lights from the trains would add to the at-grade lights from roadway lights and vehicles traveling on Southwest Yancy Street near Southwest Avalon Way. The removal of trees next to the West Seattle Bridge on-ramp would eliminate the screening value of the trees for screening lights from vehicles traveling on the on-ramp. Shadows from the elevated guideway would not be cast on the Longfellow Creek Natural Area and other open spaces used by the public due its location and height.

4.2.4 West Seattle Junction Segment

Table 4-4 identifies locations within the West Seattle Junction Segment where there would be visual impacts (a reduction of one or more visual quality categories) near areas containing concentrations of sensitive viewers. Simulations developed for the West Seattle Junction Segment in Attachment N.2A serve as a guide to understand how visual quality will change with the alternative from clear vantage points. Cross sections and 3D views are provided in Attachment N.2B to illustrate the general height, bulk, and scale of the different station types (elevated or tunnel) in this segment. For additional information related to station design, see the Sound Transit Station Area Development Opportunities Memo (Sound Transit in development).

Table 4-4. West Seattle Junction Segment Visual Quality Impacts near Concentrations of Sensitive Viewers

Alternative or Design Option	Visual Quality Impacts (miles) [a]	Where Visual Impacts Would Occur
Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)	**0**	**None**
Elevated 41st/42nd Avenue Station Alternative (WSJ-1)	0.1	Residences along 42nd Avenue Southwest, Southwest Hudson Street, and California Avenue Southwest
Elevated Fauntleroy Way Station Alternative (WSJ-2)	0.2	Residences along 36th Avenue Southwest, 37th Avenue Southwest, and 38th Avenue Southwest
Tunnel 41st Avenue Station Alternative (WSJ-3a)	0	None
Tunnel 42nd Avenue Station Option (WSJ-3b)	0	None
Short Tunnel 41st Avenue Station Alternative (WSJ-4)	0	None
Medium Tunnel 41st Avenue Station Alternative (WSJ-5a)	0	None
No Avalon Station Tunnel Alternative (WSJ-6)	0	None

[a] Visual impacts occur when an existing visual quality category (high, average, low) is reduced one or more categories. Visual impacts are in miles along the length of the alternative or option adjacent to concentrations of sensitive viewers.

4.2.4.1 Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Preferred Option WSJ-5b would enter the West Seattle Junction Segment from the northeast in a retained cut between the West Seattle Bridge on-ramp and 32nd Avenue Southwest. It would continue under Fauntleroy Way Southwest in a retained cut and enter a tunnel west of 37th Avenue Southwest. Single-family residences between the West Seattle Bridge on-ramp and the southern portion of 32nd Avenue Southwest would be removed, as would single-family residences along Southwest Genesee Street and multi-family buildings that face Southwest Avalon Way whose backs face the area where residences would be removed. The removals could change the existing residential visual character of views from remaining residences to a vacant lot or transportation character. Sound Transit would use the lots where residences would be removed for the construction of the guideway. Although the removal of residential buildings (and associated vegetation) in a residential neighborhood would be very noticeable to residents, the average visual quality of views from remaining residences toward Preferred Option WSJ-5b would not be reduced to low and would not be considered a visual impact.

The Avalon Station entrances would be on either side of 35th Avenue Southwest and would be seen primarily by travelers along 35th Avenue Southwest and Southwest Avalon Way. Residents users would be the primary sensitive viewers in the area (represented by KOP WS-27). The Alaska Junction Station is also below ground and the entrances would be seen by residential viewers. The stations would not be considered a visual impact. Adjacent residential viewers would see the above-ground station structures with a similar height, bulk and scale as the adjacent buildings. The stations would increase the visual coherence of the area and would be considered a visual benefit.

City of Seattle Designated Scenic Routes and Public View Protection

The Preferred Option WSJ-5b guideway would parallel the West Seattle Bridge, which is a City of Seattle Designated Scenic Route. Residences and some vegetation that currently screen views to the east from the bridge (and of the bridge from nearby residences) in this area would be removed. Views to the east beyond the bridge may be opened up towards the residential buildings with this alternative. From the remaining residence along the south end of 32nd Avenue Southwest the alignment and the ancillary components would be noticed and partially obscure views to the downtown skyline. This alternative would have an effect on City of Seattle protected views.

Along 35th Avenue Southwest, a City of Seattle Designated Scenic Route, the presence of Preferred Option WSJ-5b in the foreground of the view looking north would slightly increase the vividness, intactness, and unity of the view. The Avalon Station would be another human-made element that characterizes and visually improves the integrity of the existing view and would not distract or intrude from views to the downtown skyline or Cascade Mountains due to the natural topography, existing buildings, and existing vegetation in the foreground. Other than the City of Seattle Designated Scenic Routes, there are no relevant City of Seattle protected views in this segment.

Light, Glare, and Shadows

Although part of the Preferred Option WSJ-5b guideway would be in a retained cut and a tunnel, lights from light rail trains might be seen from adjacent properties and from the West Seattle Bridge on-ramp.

4.2.4.2 Elevated 41st/42nd Avenue Station Alternative (WSJ-1)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative WSJ-1 would begin near the elevated Avalon Station (the height to the top of the station would be approximately 70 feet to 80 feet, depending on which alternative it would connect to in the Delridge Segment) and proceed west to where it would curve to the southeast to pass over to the northwest side of Fauntleroy Way Southwest. Fauntleroy Place park would be permanently removed with this alternative, so there would be no visual impacts to views from the former park site. However, adjacent residential viewers would see a change of visual character in the neighborhood with an elevated guideway. The height of the elevated guideway would range from about 30 feet to 80 feet. The guideway would depart Fauntleroy Way Southwest and curve to the southwest over 39th Avenue Southwest, 40th Avenue Southwest, and 41st Avenue Southwest before crossing south over Southwest Alaska Street to the Alaska Junction Station, which would be bounded by Southwest Alaska Street, Southwest Edmunds Street, 41st Avenue Southwest, and 42nd Avenue Southwest. From the station, the elevated guideway would travel south to it terminus north of Southwest Hudson Street. The guideway would end on the west side of 42nd Avenue Southwest and would include a tail track south of the Alaska Junction Station

Alternative WSJ-1 would change the visual character at its east end near the Avalon Station. Residential viewers living in the remaining single-family residences on both sides of Southwest Genesee Street would see the changes, as would viewers living in a series of multi-family buildings on Southwest Avalon Way. With this alternative, a multi-family residential building and all of the single-family residences along Southwest Genesee Street would be removed and replaced with the elevated guideway and Avalon Station. The top of the station would be approximately 70 to 80 feet in height (see Figure 1-12 in Attachment N.2B). The appearance and character of the area would change from residences to the north. The elevated station and

its associated plaza would maintain the area's average visual quality. The height, bulk, and scale of the elevated Avalon Station would be similar to that of the five- to six-story multi-family buildings that face Southwest Avalon Way directly south of the station. The station plaza would provide an at-grade visual connection to Southwest Genesee Street, the multi-family buildings on Southwest Avalon Way, and Fauntleroy Way Southwest. The average visual quality of views towards this alternative would be slightly increased to high average by the presence of the station and station plaza the resulting increase in visual intactness, vividness, and unity.

Alternative WSJ-1 would pass south of another area with concentrations of sensitive (residential) viewers; this area is northwest of, and behind, the series of commercial buildings that line the northwest side of Fauntleroy Way Southwest. The removal of these buildings (and associated trees) would eliminate their screening value in terms of screening views to the southeast of Fauntleroy Way Southwest from the residences. The residences would have clear views of the elevated guideway, passing trains, and Fauntleroy Way Southwest. Although the visual character of the views from residences in these areas would change from commercial to transportation, the existing low to low average visual quality of the views (that currently feature the backs and/or roofs of commercial buildings/properties) would not be reduced by the presence of the elevated guideway and new streetscape, and there would not be a visual impact.

The area west of the Fauntleroy Way Southwest and Southwest Alaska Street intersection and south of Southwest Alaska Street contains several concentrations of sensitive viewers. Mixed use, with some multi-family residential and multi-story commercial buildings are within this general area along Southwest Alaska Street (between 41st Avenue Southwest and 42nd Avenue Southwest). The replacement of large mixed-use buildings would be clearly seen by some nearby residents. The large-scale mixed-use, urban visual character of the area would be replaced with a large-scale transportation character, which would include the elevated guideway and the height, bulk, and scale of the Alaska Junction Station. The average visual quality of views in the direction of the elevated guideway and station would not be lowered enough to reduce the visual quality category to low, and there would not be an impact to visual quality.

Impacts to visual quality from Alternative WSJ-1 would occur at the south end of the alignment where the tail track and hi-rail access would remove residences along the west side of 42nd Avenue Southwest between Southwest Edmunds Street and Southwest Hudson Street. The removal of residences and replacement with the tail track and hi-rail access would change the visual character of this area (represented in KOP WS-31) from residential to transportation facility (see Figure 4-6b in Attachment N.2A). The existing high average visual quality of views towards this area from the remaining residential areas would be reduced to low, which would be a visual impact.

City of Seattle Designated Scenic Routes and Public View Protection

The portion of Fauntleroy Way Southwest and its ramp to the West Seattle Bridge and 35th Avenue Southwest are City of Seattle Designated Scenic Routes. Alternative WSJ-1 would cross over Fauntleroy Way Southwest just before it links to the West Seattle Bridge but would not intrude upon or block views of notable features like the downtown skyline (which cannot be seen from this location). Other than the City of Seattle Designated Scenic Routes, there are no relevant City of Seattle protected views in this segment.

Along 35th Avenue Southwest, the distant presence of the Alternative WSJ-1 elevated guideway in the background of the view looking north would not lower the vividness, intactness, or unity of the view. The elevated guideway would be another human-made element that characterizes the existing view conditions and would not distract or intrude from views of the downtown skyline or Cascade Mountains beyond due to the natural topography, existing buildings, and existing vegetation in the foreground.

Light, Glare, and Shadows

Elevated stations like the Avalon and Alaska Junction stations would have lights that would be seen from nearby locations, including some buildings containing sensitive residential viewers. The elevated guideway, tail track, and hi-rail vehicle access would also have lighting that would be seen from nearby residential areas. At-grade vehicle lights and overhead airplane lights are common sights within most of this segment. Elevated lights on trains would be new additions to lights seen in the West Seattle Junction Segment. The lights from passing trains would not impact motorists, pedestrians, and the surrounding area.

4.2.4.3 Elevated Fauntleroy Way Station Alternative (WSJ-2)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative WSJ-2 would be elevated along the south side of Southwest Genesee Street between 31st Avenue Southwest and Fauntleroy Way Southwest. The height of Avalon Station would be approximately 60 to 70 feet (depending on the alternative it connects with in Delridge) and would be similar in height, bulk, and scale compared to the surrounding neighborhood as described for Alternative WSJ-1. The height of the elevated guideway for the Alternative WSJ-2 would range between approximately 30 feet and 70 feet. After crossing south over and continuing southwest along Fauntleroy Way Southwest (see Figure 4-5b in Attachment N.2A). Alternative WSJ-2 would remove street-facing commercial buildings and vegetation on Fauntleroy Way Southwest and residences on nearby side streets, opening up views to the south toward Fauntleroy Way Southwest and the elevated guideway from remaining residences. This would change the residential character of most of the views to transportation. The existing average visual quality of views to the south from the remaining residences between 36th Avenue Southwest, 37th Avenue Southwest, and 38th Avenue Southwest would not change. As with Alternative WSJ-1, Fauntleroy Place park would be permanently removed with Alternative WSJ-2, so there would be no visual impacts to views from the former park. However, adjacent residential viewers would see a change of visual character in the neighborhood with an elevated guideway but due to the alignment being consistent with an existing transportation system it would not enough to change the visual quality.

Alternative WSJ-2 would cross south over Fauntleroy Way Southwest, and its elevated guideway would connect with the elevated Alaska Junction Station (with a height of 70 to 80 feet) that would straddle Southwest Alaska Street (see Figure 4-4c in Attachment N.2A). The station and the elevated guideway south of the station would be seen from several multi-family residential buildings along the west side of 39th Avenue Southwest. The station would be constructed in an area currently containing small commercial buildings, a gas station, and a parking lot. The elevated station, plaza, and guideway would be more memorable elements in this view than the current mix of land uses and buildings. The height, bulk and scale of the elevated Alaska Junction Station would be compatible with nearby buildings and would follow the street pattern in this location. The station and its associated plaza would simplify the visually complex intersection area and add a unifying architectural element. The low visual quality of views toward the intersection that are seen by nearby residences would improve to average, which would be a beneficial change. The elevated guideway as it extends further south on Fauntleroy Way Southwest would be seen by sensitive viewers from multi-family residential on both the east and west side of Fauntleroy Way Southwest. While the guideway would become more memorable, the height, bulk and scale of the alignment would be compatible with nearby buildings and follow the street pattern as a transportation element.

City of Seattle Designated Scenic Routes and Public View Protection

Alternative WSJ-2 would twice pass over the section of Fauntleroy Way Southwest that is a City of Seattle Designated Scenic Route. The elevated guideway would not intrude upon or block views of notable features such as the downtown skyline.

Along 35th Avenue Southwest, and similar to Alternative WSJ-1, the distant presence of the elevated guideway of the Alternative WSJ-2 alignment in the background of the view looking north would not lower the vividness, intactness, or unity of the view. The guideway would be another human-made element that characterizes the existing view conditions and would not distract or intrude from views of the downtown skyline or Cascade Mountains beyond due to the natural topography, existing buildings, and existing vegetation in the foreground. Other than the City of Seattle Designated Scenic Routes, there are no relevant City of Seattle protected views in this segment.

Light, Glare, and Shadows

With Alternative WSJ-2, both the elevated Avalon and Alaska Junction stations would have lights that would be seen from nearby locations, including residential buildings with sensitive viewers. At-grade vehicle lights along Fauntleroy Way Southwest and nearby streets are common sights along most of this segment. Elevated lights on light rail trains would be new additions to light views seen by sensitive viewers, including residents living in multi-family buildings at about the same height as the elevated guideway. The presence of passing light rail train lights could be noticed by some residents. The shadows cast by Alternative WSJ-2 on open spaces used by the public would be similar to those described for Alternative WSJ-1.

4.2.4.4 Tunnel 41st Avenue Station Alternative (WSJ-3a)

Alternative WSJ-3a (and the other tunnel alternatives) would produce few changes to the visual character and quality of portions of its route seen by the greatest concentrations of sensitive viewers. The most noticeable change to existing visual conditions would be near the southern portion of this alternative. Alternative WSJ-3a would require the demolition of a number of buildings, including several stories-high multi-family buildings along the east side of 41st Avenue Southwest that are directly across the street from a large multi-family residential complex. The removal of these buildings would change the residential character of the east side of 41st Avenue Southwest to vacant lot or transportation character and would be seen from the adjacent residences. The average visual quality to the east from the multi-family complex west of 41st Avenue Southwest would not be reduced to low and would therefore not be a visual impact. Construction of the underground tracks employ a cut-and-cover method, which would require the removal of residences on the east side of 41st Avenue Southwest between Southwest Edmunds Street and Southwest Hudson Street. The removal of these residences would change the existing residential visual character of the area when viewed from remaining residences to a vacant lot or transportation character. The presence of the above-ground egress and vent shaft structure associated with Alternative WSJ-3a and the cleared land would not reduce the average visual quality of views towards the areas to low and therefore would not be a visual impact.

4.2.4.5 Tunnel 42nd Avenue Station Option (WSJ-3b)

Option WSJ-3b would be essentially the same as Alternative WSJ-3a, but the guideway would pass under the surface of slightly different locations. Residences would be removed for the elevated guideway and above-ground egress and vent shaft along the east side of 42nd Avenue Southwest between Southwest Edmunds Street and Southwest Hudson Street. As with Alternative WSJ-3a, this design option would change the character of the area where residences would be removed but would not lower the average visual quality of views toward the area to low; therefore, it would not be a visual impact.

4.2.4.6 Short Tunnel 41st Avenue Station Alternative (WSJ-4)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative WSJ-4 would pass near several areas with concentrations of sensitive viewers. Alternative WSJ-4 would have Avalon Station at about 60 to 70 feet high. The height, bulk, and scale of the station might differ from some of the land uses that would remain next to it, but would be similar to the height, bulk, and scale of multi-story, mixed-use buildings that are being developed and will continue to be built in the area. The guideway would begin elevated about 40 feet high near the Avalon Station (which is closer in height to nearby multi-family buildings), head west, and cross over Fauntleroy Way Southwest. After crossing Fauntleroy Way Southwest, the alternative curves southwest and parallels Fauntleroy Way Southwest to the northwest. Alternative WSJ-4 would remove single-family residences along either side of Southwest Genesee Street and, after passing over Fauntleroy Way Southwest, would remove a series of buildings and vegetation north of Fauntleroy Way Southwest. The removal of these features would open up views to the south that are currently blocked by the buildings and trees. The new open views to the south from remaining residences would include Fauntleroy Way Southwest and the elevated guideway, which would change the character of most of the views from residential to transportation. The average visual quality of these views would be reduced to low average, which would not be a visual impact.

The West Seattle Junction Station would be in a tunnel along 41st Avenue Southwest, starting south of Southwest Alaska Street. To build the station, Alternative WSJ-4 would require the demolition of a number of buildings, including several stories-high multi-family buildings along the east side of 41st Avenue West that are directly across the street from a large multi-family residential complex. The removal of these buildings would change the residential character of the east side of 41st Avenue Southwest to vacant lot or transportation character and would be seen from the adjacent residences. The average visual quality to the east from the multi-family complex west of 41st Avenue Southwest would likely not be reduced, and therefore would not be a visual impact.

The other location of where residences would be removed for the elevated guideway and above-ground egress vent shaft would be along the west side of 41st Avenue Southwest from Southwest Edmunds Street to mid-block south of Southwest Hudson Street. As with Alternative WSJ-3a, Alternative WSJ-4 would change the character of the area where residences would be removed but would not lower the average visual quality of views toward the area to low, and thus would not be a visual impact.

City of Seattle Designated Scenic Routes and Protected Views

Alternative WSJ-4 would pass over the section of Fauntleroy Way Southwest that is a City of Seattle Designated Scenic Route. The elevated guideway would not intrude upon or block views of notable features such as the downtown skyline.

Along 35th Avenue Southwest, the distant presence of the elevated guideway of the Alternative WSJ-4 alignment in the background of the view looking north would not lower the vividness, intactness, or unity of the view. The guideway would be another human-made element that characterizes the existing view conditions and would not distract or intrude from views of the downtown skyline or Cascade Mountains beyond due to the natural topography, existing buildings, and existing vegetation in the foreground. Other than the City of Seattle Designated Scenic Routes, there are no relevant City of Seattle protected views in this segment.

Light, Glare, and Shadows

Lights at the elevated Avalon Station would be seen from nearby residential areas. Measures to reduce potential light impacts associated with stations are discussed in Section 5, Sound Transit Design and Mitigation Measures. At-grade vehicle lights along Fauntleroy Way Southwest and nearby streets are a common sight along most of this segment. Elevated lights on light trail trains near Avalon Station would be additional new lights seen by sensitive viewers. The shadows cast by Alternative WSJ-4 from its elevated guideway and station would be similar to those described for Alternative WSJ-1, but along a shorter alignment.

4.2.4.7 Medium Tunnel 41st Avenue Station Alternative (WSJ-5a)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative WSJ-5a would enter the West Seattle Junction Segment from the northeast in a retained cut between the West Seattle Bridge on-ramp and 32nd Avenue Southwest. It would continue under Fauntleroy Way Southwest in a retained cut and enter a tunnel west of 37th Avenue Southwest. From the tunnel portal south, this alternative would be similar to Option WSJ-3b. Single-family residences between the West Seattle Bridge on-ramp and the southern portion of 32nd Avenue Southwest would be removed, as would single-family residences along Southwest Genesee Street and multi-family buildings that face Southwest Avalon Way whose “backs” face the area where residences would be removed. The removals could change the existing residential visual character of views from remaining residences to a vacant lot or transportation character. Although the removal of residential buildings (and associated vegetation) in a residential neighborhood would be very noticeable to residents, the average visual quality of views from remaining residences toward Alternative WSJ-5a would not be reduced to low and would not be considered a visual impact.

West of Fauntleroy Way Southwest and near the elevated guideway at the southern terminus of Alternative WSJ-5a, this alternative’s influence on the visual quality of views from areas with concentrations of sensitive viewers would be very similar to that of Alternative WSJ-3a.

The Avalon Station entrances would be on either side of 35th Avenue Southwest and would be seen primarily by travelers along 35th Avenue Southwest and Southwest Avalon Way. The Alaska Junction Station is also below ground and the entrances would be seen by residential viewers (represented by KOP WS-27). The stations would not be considered a visual impact. Adjacent residential viewers would see the above-ground station structures with a similar height, bulk, and scale as the adjacent buildings. The stations would increase the visual coherence of the area and would be considered a visual benefit.

City of Seattle Designated Scenic Routes and Protected Views

Part of the Alternative WSJ-5a guideway would parallel the West Seattle Bridge, which is a City of Seattle Designated Scenic Route. Residences and some vegetation that currently screen views to the east from the bridge (and of the bridge from nearby residences) in this area would be removed. Views to the east beyond the bridge may be opened up with this alternative.

Along 35th Avenue Southwest, the distant presence of the elevated guideway of Alternative WSJ-5a in the background of the view looking north would not lower the vividness, intactness, or unity of the view. The elevated guideway would be another human-made element that characterizes the existing view conditions and would not distract or intrude from views of the downtown skyline or Cascade Mountains beyond due to the natural topography, existing buildings, and existing vegetation in the foreground. Other than the City of Seattle Designated Scenic Routes, there are no relevant City of Seattle protected views in this segment.

Light, Glare, and Shadows

Although part of the Alternative WSJ-5a guideway would be in a retained cut and a tunnel, lights from light rail trains might be seen from adjacent properties and from the West Seattle Bridge on-ramp.

4.2.4.8 No Avalon Station Tunnel Alternative (WSJ-6)

Impacts to Visual Quality near Areas with Concentrations of Sensitive Viewers

Alternative WSJ-6 would enter a tunnel within the Delridge Segment on the east side of the West Seattle Bridge and remain in a tunnel condition through the entire West Seattle Junction Segment. The station above-ground ancillary elements would be seen by residential sensitive viewers along 41st Avenue Southwest and the planned West Seattle Junction Park. However, these ancillary elements are another human-built component and would not be considered a visual quality impact.

City of Seattle Designated Scenic Routes and Public View Protection

Alternative WSJ-6 would not have a visual impact on City of Seattle Designated Scenic Routes or Public View Protection areas, as the alignment is underground in a tunnel configuration throughout the West Seattle Junction Segment with the exception of the above-grade ancillary components of the station at Alaska Junction.

Light, Glare, and Shadows

The Alternative WSJ-6 alignment would not have any visual impacts on light, glare, or shadows due to the underground tunnel configuration.

4.3 Construction Impacts

Activities related to building the project would have temporary impacts on the visual environment. Section 2.7, Construction Approach, in Chapter 2 of the Final EIS provides an overview of potential construction activities and timing. The construction period for the project is anticipated to occur over a 5-year period. During this time, many construction activities and related effects would be seen by sensitive viewers, such as moving and storing equipment and materials; exposing soils; glare and lights associated with nighttime construction; storing construction materials; using cranes, in-water equipment, and barges for bridge construction; installing and using work trestles on Pigeon Point, and making general visual changes to the viewed landscape during the project construction period. As detailed in Table 2-6, Major Construction Activities and Duration, in Chapter 2 of the Final EIS, demolition and clearing activities are estimated to last between 2 months and 12 months, guideway construction between 2 years and 4 years, bridge construction between 3 years and 4 years over the Duwamish Waterway, tunnel construction approximately 2 years, and elevated station construction about 3 years. All of these activities would be seen by the public and some would be nearby and seen by sensitive viewers. Staging areas throughout the project corridor would range in size from about 1 acre per mile for elevated or at-grade construction to 3 to 5 acres for water-crossing structure construction.

Views toward the project for sensitive viewers will change during the construction period, and there will be impacts of varying degrees. Measures to reduce the effect of construction activities on views seen by sensitive viewers are identified in Section 5.

4.4 Indirect Impacts

The project could support changes to nearby land uses in station areas, as allowed by zoning. Increases in density of development that are allowed under zoning could occur and would likely be consistent with existing new development in West Seattle. This might result in changes to the visual setting of the areas where the project would support new and more dense development around station areas.

4.5 Consistency with Policies

As described in Section 2.3, Regulatory Requirements, the ordinance with the greatest number of policies that were examined for this technical report is Seattle Municipal Code Section 25.05.675, Specific Environmental Policies. The policies to examine are Policy P, Public View Protections (with an emphasis on views from City of Seattle Designated Scenic Routes); Policy K, Light and Glare; Policy Q, Shadows on Open Spaces; and Policy G, Height, Bulk and Scale. The effects of the project alternatives on Policies P, K, and Q are discussed in Sections 4.1, No Build Alternative, and 4.2, Build Alternatives, for each alternative's assessment; Policy G is discussed in Section 4.5.1 below and will be examined during the design review phase of the project.

There are other City of Seattle ordinances and policies that Sound Transit will need to consider, as appropriate, in coordination with the City of Seattle as part of the project that would have some influence on visual and aesthetic resources. In many cases, project design details related to the project are not far enough along to address the ordinances and/or policies, and in other cases the ordinances and policies are addressed in other sections of the Final EIS or will be addressed during final design. The following sections list some of the ordinances and policies that Sound Transit will need to examine for the project and include assessment related to visual and aesthetic resources.

4.5.1 Seattle Municipal Code Section 25.05.675, Specific Environmental Policies

Seattle Municipal Code Section 25.05.675 contains Policy G, Height, Bulk and Scale. This policy states that it is City policy that the "height, bulk, and scale of development projects should be reasonably compatible with the general character of development anticipated by the goals and policies set forth in the Land Use Element, Growth Strategy Element, and Shoreline Element of the Seattle Comprehensive Plan; the procedures and locational criteria for shoreline environment resignations set forth in Sections 23.60A.060 and 23.60A.220; and the adopted land use regulations for the area in which they are located, and to provide for a reasonable transition between areas of less intensive zoning and more intensive zoning." It describes how impacts might be mitigated. This policy goes on to state that a "project that is approved pursuant to the design review process is presumed to comply with these height, bulk, and scale policies. This presumption may be rebutted only by clear and convincing evidence that height, bulk, and scale impacts documented through environmental review have not been adequately mitigated. Any additional mitigation imposed by the decisionmaker pursuant to these height, bulk, and scale policies on projects that have undergone design review shall comply with design guidelines applicable to the project." This policy will be examined during the design review phase of the project.

4.5.2 Seattle Municipal Code Section 23.60A, Shoreline Master Program

The City's Shoreline Master Program contains two policies that may apply to the project. The first is Policy Q of Section 23.60A.152, General Development, which contains standards for lighting that states "Artificial night lighting shall first be avoided. If that is infeasible, lighting

should minimize night light impacts on the aquatic environment by focusing the light on the pier surface, using shades that minimize illumination of the surrounding environment and using lights that minimize penetration into the water, to the maximum extent feasible, considering the activities that occur at the site at night." The second possibly applicable policy includes Section 23.60A, which also contains policy sections under "Development" that describe view corridor requirements for development of "lots" on private lands and within public rights-of-way that are subject to Shoreline Master Program requirements. These requirements vary by shoreline designation but may require that view corridors of varying percentages of "lot" width (for developments on shoreline lots) be established on the lots to maintain views of the water from upland areas. This policy will be examined during the design review phase of the project.

4.5.3 Seattle Design Guidelines

The City of Seattle's Design Guidelines are the primary tool used in the review of proposed private projects by the Department of Construction and Inspections for administrative design review, and/or by Design Review Boards (City of Seattle 2013a). These guidelines apply to all areas of the city except downtown and are used in tandem with neighborhood plans.

The design guidelines are organized around three themes: context and site, public life, and design concept. Each theme includes three to four individual guidelines. The various guidelines within each theme can provide a large-scale transportation project such as the project with guidance to, among other things: help a proposed project employ the natural systems and features of a site; strengthen the urban pattern and form of the area surrounding the proposed project; provide and strengthen a sense of place near the proposed project; contribute to the architectural character of the neighborhood the proposed project would be in; improve the quality of public life by considering how a proposed project would reinforce or emphasize connectivity, walkability, street-level interactions among people; and integrate transportation systems.

In addition to the City's design guidelines, neighborhood guidelines have been developed that provide specific guidance for proposed projects in those neighborhoods. Several neighborhoods that the project would pass through have specific neighborhood design guidelines. The City's design guidelines are applied to neighborhoods that do not have specific neighborhood plans. Neighborhood design guidelines have "purview over all physical design elements within the private property lines." Some neighborhood design guidelines may contain comments related to design features outside of, but adjacent to, private property lines such as sidewalks and landscaping. These comments are advisory only. It should be noted that elements within public rights-of-way are under the purview of the Seattle Department of Transportation.

4.5.4 West Seattle Junction Neighborhood Design Guidelines

The West Seattle Junction design guidelines apply to proposed development projects in the West Seattle Urban Village that would be subject to design review (City of Seattle 2013b). The West Seattle design guidelines are organized around three themes: context and site, public life, and design concept. Guidelines within each theme can provide a large-scale transportation project such as the West Seattle Link Extension with guidance in the following:

- Using the natural systems and features of a site
- Strengthening the urban pattern and form of the portion of the West Seattle Junction area surrounding the West Seattle Link Extension
- Providing and strengthening a sense in the portion of the West Seattle Junction area near the West Seattle Link Extension

- Contributing to the architectural character of the neighborhood
- Improving the quality of public life by considering how the project would reinforce or emphasize connectivity, walkability, street-level interactions among people
- Integrating transportation systems

The stations associated with the various project alternatives would be designed to meet the intentions of the guidelines highlighted above. This will be accomplished through coordination with the City of Seattle.

The guidelines also identify Fauntleroy Way Southwest as a major pedestrian street and the portions of Southwest Oregon, Alaska, and Edmunds streets as important pedestrian connections. The walkability section of the design guidelines describes measures to create safe and comfortable walking environments that would be of relevance to the West Seattle Link.

Streetscapes associated with project stations and the rebuilding of sidewalks that would be removed during construction would help meet these aspirations.

The design guidelines also identify several gateways within the neighborhood. The project would pass by a gateway at Southwest Alaska Street and Fauntleroy Way Southwest as well as a gateway at Fauntleroy Way Southwest and 35th Avenue Southwest. Alternative WSJ-3a would include an elevated station over Southwest Alaska Street and Fauntleroy Way Southwest that would help create a gateway into this area. The stations in the Southwest Avalon Way area that would be on either side of 35th Avenue Southwest would help create gateways into the neighborhood.

This page is intentionally left blank.

5 SOUND TRANSIT DESIGN AND MITIGATION MEASURES

5.1 Introduction to Design and Mitigation Measures

The project would result in changes in the visual environment of varying degrees throughout the project segments. Sound Transit has developed design measures that, where practical, would be incorporated into the project to help the alternatives visually fit in with their surroundings. In addition, Sound Transit has developed mitigation measures to reduce visual impacts of the project.

5.2 Sound Transit Design Measures

The following describes the design measures that Sound Transit would incorporate:

- Sound Transit would develop specific design criteria for the project that guide project design through a balanced set of systemwide elements and contextual elements, such as a consistent architectural theme for elevated elements and stations, consistent signage, and a systemwide art program. Interdisciplinary teams would develop these criteria with input from local communities and the City of Seattle and integrate these criteria with existing plans, including plans for redevelopment.
- Sound Transit will work collaboratively with applicable City of Seattle agencies and adjacent communities throughout the design process to minimize visual impacts and develop a civic aesthetic for each station that is aligned with the community vision.
- Through design review in coordination with the City of Seattle, Sound Transit would consider measures to minimize impacts to visual quality from the Duwamish water crossings, such as design guidelines and context-sensitive design.
- Sound Transit would surplus the remainder of the parcels, not needed after construction, which could potentially be redeveloped consistent with Sound Transit's Transit Oriented Development Policies and City of Seattle plans.
- When possible, Sound Transit would preserve existing vegetation.
- Sound Transit would plant appropriate vegetation within and adjoining the project right-of-way to replace existing street trees and other vegetation removed for the project, or provide screening for sensitive visual environments and/or sensitive viewers. New plantings would be consistent with Sound Transit operations and maintenance requirements and would be low-maintenance-type plant material for the long-term growth and health of the plantings. The planting design would emphasize the use of native, adaptive, hardy, drought tolerant, low-maintenance material that can attract bees and butterflies and exist without supplemental water in the local climate after the establishment period.
- Sound Transit would design exterior lighting at stations, tail tracks, and hi-rail access to minimize height and use source shielding to avoid lighting bulbs that would be directly visible from residential areas, streets, and highways. Shielding would also limit spillover light and glare in residential areas.
- During construction, Sound Transit would provide visual screening along some areas where construction activities would be seen by nearby sensitive viewers. Visual screening would include construction of a barrier to screen ground-level views into construction areas where practical. Nighttime construction lighting would be shielded and directed downward to avoid light spillover onto adjacent sensitive uses.

5.3 Mitigation Measures

In addition to the design measures described in Section 5.2, Sound Transit has developed the mitigation measures described in the following sections, which would be applied within the project study area near the locations of sensitive viewers shown on Figures 3-1, 3-2, and 3-3. Sound Transit would further refine the mitigation measures as project design progresses. The design of all structures for the alternative selected to be built, including access ramps, traction power substation facilities, and vent structures, will continue to be refined through preliminary design to minimize visual impacts to surrounding sensitive viewers.

The following are descriptions by segment of where the site-specific mitigation measures within the project study area would be applied. Most of the visual quality impacts to these areas would be mitigated by planting screening vegetation where appropriate along the edge of construction footprints or within residential properties (if desired by residents) to screen views of proposed project components and/or areas that are currently screened by vegetation that would be removed. Existing plant material would be protected to the greatest extent possible to preserve a sense of scale and history. Plant material would be used to enhance the visual quality of the station areas and to integrate them with their surrounding environment. Plant selection would be limited to native and adaptive plants that are suitable for the northwest climate and will thrive in the environment in which they are planted. For safety purposes, vegetation types and locations would adhere to Sound Transit clear zone requirements and setbacks. It should be noted that the use of vegetation to buffer or screen views of Build Alternative elements would not provide immediate mitigation. Depending upon the location of the vegetation in relationship to sensitive viewers, distance to Build Alternative elements, size of the elements, and the growth rates of the vegetation selected, effective screening of the elements could take 5 to 10 years and perhaps as long as 15 years. Impacts associated with some of the higher elements of the alternatives, such as bridges crossing the West Waterway or the taller alternatives passing along Southwest Genesee Street, could not be mitigated. The impacts of the elements on sensitive viewers could be lessened with the strategic planting of vegetation, but the elements themselves would be too large to screen and they would produce unavoidable impacts.

5.3.1 Duwamish Segment

5.3.1.1 Area 1: Residential Areas along 22nd Avenue Southwest and 23rd Avenue Southwest

The following measure would apply to Preferred Alternative DUW-1a and Option DUW-1b:

- Following construction, plant vegetation where appropriate to screen views of areas to the west, elevated guideway, and Delridge Way Southwest from remaining residences on 23rd Avenue Southwest.

5.3.2 Delridge Segment

5.3.2.1 Area 1: Residences along Delridge Way Southwest and 23rd Avenue Southwest from Eastern Edge of Segment to Southwest Andover Street

The following measure would apply to Preferred Option DEL-6b, Alternative DEL-1a, Option DEL-1b, Alternative DEL-2a, Option DEL-2b, Alternative DEL-3, Alternative DEL-4, and Alternative DEL-7:

- Following construction, plant vegetation where appropriate to screen views of areas to the west, the elevated guideway, and Delridge Way Southwest from remaining residences on 23rd Avenue Southwest.

5.3.2.2 Area 2: 23rd Avenue Southwest South of Southwest Andover Street

The following measure would apply to Alternative DEL-3 and Alternative DEL-4:

- Following construction, plant vegetation where appropriate to screen views of elevated guideway, Delridge Way Southwest, and views to the west from remaining residences on 23rd Avenue Southwest.

5.3.2.3 Area 3: Delridge Way Southwest, 25th Avenue Southwest, and 26th Avenue Southwest

The following measure would apply to Preferred Option DEL-6b, Alternative DEL-1a, Option DEL-1b, Alternative DEL-2a, Option DEL-2b, Alternative DEL-3, Alternative DEL-4, and Alternative DEL-7:

- Following construction, plant vegetation where appropriate to screen views of elevated guideway from remaining residences along Delridge Way Southwest, 25th Avenue Southwest, and 26th Avenue Southwest.

5.3.2.4 Area 4: Delridge Playfield and Community Center

The following measure would apply to Alternative DEL-1a, Option DEL-1b, Option DEL-2b, Alternative DEL-3, and Alternative DEL-4:

- Following construction, plant screening vegetation where appropriate within the northwest edge of the park, if the City of Seattle desires, to screen views of the elevated guideway.

5.3.2.5 Area 5: West Seattle Golf Course

The following measures would apply to Alternative DEL-1a, Option DEL-1b, and Alternative DEL-3:

- Although the elevated guideway could not be screened by vegetation, plant vegetation where appropriate to screen views of Southwest Genesee Street and frame views of the downtown skyline.
- Following construction, plant vegetation in a manner and pattern similar to the vegetation within the golf course that would be removed for construction.

Because Option DEL-2b would not enter the golf course's area of play, no mitigation measures are recommended.

The following measure would apply to Alternative DEL-2a and Alternative DEL-4:

- Redesign and revegetate the north end of the golf course that would be impacted and include screening vegetation where appropriate to block views of the elevated guideway, transition to the portal, and portal.

5.3.2.6 Area 6: Residential Areas North of Southwest Genesee Street and Longfellow Creek Natural Area

The following measures would apply to Preferred Option DEL-6b, Alternative DEL-1a, Alternative DEL-2a, Alternative DEL-3, Alternative DEL-4, and Alternative DEL-7:

- Following construction, plant vegetation where appropriate that would not conflict with the light rail operations in front of remaining residences on north side of Southwest Genesee Street to replace vegetation removed for construction.
- Following construction, plant screening vegetation where appropriate along perimeter of stormwater detention facility to block views from adjacent residences.

The following measure would apply to Option DEL-1b and Option DEL-2b:

- Following construction, plant replant vegetation (subject to Sound Transit height restrictions for vegetation planted near elevated guideways) in front of remaining residences on north side of Southwest Genesee Street, to replace vegetation removed for construction.

5.3.2.7 Area 7: Southwest Avalon Way

Preferred Option DEL-6b, Alternative DEL-5, Alternative DEL-6a, and Alternative DEL-7 would place an elevated guideway over the center of Southwest Avalon Way. It would be clearly seen by adjacent residents, but there would be no mitigation measures to reduce its impact due to limited planting areas within the plaza and pedestrian circulation areas. Therefore, no mitigation measures are recommended in this area.

5.3.2.8 Area 8: Southwest Yancy Street

The following measure would apply to Preferred Option DEL-6b, Alternative DEL-5, Alternative DEL-6a, and Alternative DEL-7:

- Following construction, plant vegetation where appropriate to help screen views of the elevated guideway from remaining industrial buildings on both sides of Southwest Andover Street and Southwest Yancy Street.

5.3.2.9 Area 9: 32nd Avenue Southwest

The following measure would apply to Preferred Option DEL-6b, Alternative DEL-6a, and Alternative DEL-7:

- Following construction, plant vegetation where appropriate to help screen views of the elevated guideway from remaining residences on both sides of 32nd Street Southwest.

5.3.3 West Seattle Junction Segment

5.3.3.1 Area 1: North of Fauntleroy Way Southwest along 35th Avenue Southwest, 37th Avenue Southwest, 38th Avenue Southwest, and 39th Avenue Southwest

The following measure would apply to Alternative WSJ-1 and Alternative WSJ-2:

- Following construction, plant screening vegetation where appropriate along the edge of construction footprint.

5.3.3.2 Area 2: Along 42nd Avenue Southwest and California Avenue Southwest.

The following measure would apply to Alternative WSJ-1:

- Following construction, plant screening vegetation where appropriate along the edge of construction footprint

5.3.3.3 Area 3: Along 35th Avenue Southwest and Southwest Genesee Street

The following measure would apply to Alternative WSJ-1:

- Following construction, plant screening vegetation where appropriate along the edge of construction footprint.

KOP	key observation point

This page is intentionally left blank.

1 INTRODUCTION

This attachment explains how the West Seattle Link Extension Project (the project) alternatives would influence the visual character and quality of the areas they would pass through, as seen from selected key observation points (KOPs). Figures 1-1 through 1-3 identify the locations of the KOPs by segment analyzed. The KOPs described in this attachment were selected in consultation with the City of Seattle. They depict a range of locations and types of views, such as views looking up at alternatives to represent views of elevated guideways from areas below them, views looking perpendicular toward alternatives to represent level views from adjacent areas, and views looking down at alternatives to represent views from hillsides toward alternatives below. KOPs were selected to represent views that would be seen by sensitive viewers from locations such as residential areas and recreation areas. Sensitive viewers include residents and users of recreation areas, such as parks, who are very familiar with, and/or concerned with, a viewed landscape and would notice changes to it. Some locations for KOPs were selected to represent views from streets and bridges that have been identified as City of Seattle Designated Scenic Routes. Several views were chosen to depict entries or gateways into neighborhoods from locations that do not necessarily have sensitive viewers but are very familiar to residents entering the neighborhood.

1.1 Simulations

The simulations included in this attachment were developed using the conceptual design drawings available when the Draft Environmental Impact Statement was being developed, or approximately 10 percent of design completion. The simulations do not contain many engineering details that would be further developed through final design and do not depict the avoidance and minimization measures described in the main section of this technical report. Overhead utility locations could change as a result of future coordination with utility providers. Sound Transit will incorporate specific measures to mitigate visual impacts as it develops the detailed design for the light rail facilities. Avoidance, minimization, and mitigation measures will be developed further by interdisciplinary teams and in coordination with the City of Seattle. These measures will likely “soften” or screen views of the components compared to how the components are depicted in the simulations contained in this attachment. These simulations are useful for depicting the form and scale of the components of the various alternatives and options as well as how they might affect views. In addition, the simulations are valuable for depicting differences between the alternatives and options.

All of the alternatives would build a bridge over the Duwamish Waterway (also known as the Duwamish River). High-level fixed bridge structure types could include a balanced cantilever segmental box girder over the East Waterway and cable-stayed or truss for the bridge over the West Waterway for Preferred Alternative DUW-1a. Option DUW-1b and Alternative DUW-2 could be constructed with a balanced cantilever segmental box girder, extradosed, cable-stayed, or truss superstructures over the West Waterway. The various types of bridges are depicted in Figure 2-50 in Section 2.7.7, Bridge Light Rail Construction - Over-water Crossings, of the Final EIS. The bridge structure types would be determined during final design based on various factors, including engineering constraints, environmental effects, cost, and coordination with other agencies on permitting requirements.

West Seattle Link Extension

1.2 Analysis Methodology

Sound Transit used a methodology specifically designed to analyze the visual impacts of linear rail projects in an urban setting. Sound Transit's methodology draws upon established Federal Highway Administration guidelines (Federal Highway Administration 1988), with several key differences such as the identification of viewer sensitivity and the use of a qualitative rather than quantitative scale. The 2015 Federal Highway Administration guidelines were also consulted (Federal Highway Administration 2015). Sound Transit's methodology was applied by professionally credentialed landscape architects. For linear projects such as the West Seattle Link Extension, it is important to select locations that can serve as representatives of areas found along routes of a proposed project from which the project would be seen. These locations are called KOPs and are used to depict current views toward a proposed project and how the views would change with the project.

The KOPs that are used in this technical report represent a variety of types of view locations and a variety of locations that would be seen by different types of viewers. The locations were selected with input from the City of Seattle.

Visual quality is an assessment of the composition of the character-defining features for selected views of landscapes. A visual quality assessment asks: Is this particular view common or dramatic? Is it a pleasing composition (with a mixture of elements that seem to belong together) or not (with a mixture of elements that either do not belong together or are visual intrusions that contrast with the other elements in the surroundings)? Visual quality is evaluated in terms of three components; vividness, intactness, and unity. The three components are described below.

Vividness is the degree of drama, memorability, or distinctiveness of the landscape. Vividness is composed of four elements—landform, vegetation, water features, and human-made elements—that usually influence the degree of vividness.

Intactness is a measure of the visual integrity of the natural and human-built landscape and its freedom from encroaching elements. Intactness is composed of two primary elements—development and encroachment—that influence the degree of intactness.

Unity is the degree of visual coherence and compositional harmony of the landscape when it is considered as a whole. High unity frequently attests to the careful design of individual components and their relationship in the landscape.

The three components of visual quality are considered together to determine visual quality. Federal Highway Administration methodology uses a seven-point scale that rates each of the three components and then divides the totals by three to come up with a visual quality rating that can be anywhere from 1 (very low) to 7 (very high). The fairly complex seven-point Federal Highway Administration scale was simplified in this technical report to three general levels of visual quality: low, average, and high. The descriptions of the three simplified visual quality categories are as follows:

Low Visual Quality – Areas with low visual quality have some combination of features that seem visually out of place, lack visual coherence, do not have compositional harmony, and/or might contain unsightly elements.

Average Visual Quality – Areas with average visual quality are commonly occurring or average-appearing landscapes that have a generally pleasant appearance but might lack enough vividness (distinctiveness, memorability, and drama), and/or intactness (the elements in the views "fit" with their natural and human-built surroundings) and/or unity (compositional harmony) to place them in the high visual quality category. Average Visual Quality is generally

the most frequent category. In this technical report, a view with high-average visual quality would have vividness, intactness, and unity characteristics that would be slightly higher than average, but not enough to qualify as high average. Likewise, a view with low-average visual quality would have slightly lower than average vividness, unity, and intactness characteristics, but not enough to have low visual quality.

High Visual Quality – Areas with high visual quality must be outstanding in terms of being very memorable, distinctive, unique (in a positive way), and/or intact—they can be natural, park-like, or urban, with urban areas displaying strong and consistent architectural and urban design features.

Because the vast majority of the visual quality of the areas the project alternatives would pass through is average, the average category was further refined to high average, average, and low average. This refinement assisted in describing changes to visual quality from alternatives in situations where the existing average visual quality of a view from a KOP might be lowered but still remain in the “average” category. By using high average, average, and low average, a better description of the influence of an alternative on visual quality could be made. For example, if an alternative lowered the existing above average visual quality of a view from a KOP to low average, that information would be important to know, rather than simply stating the average visual quality of the view from a KOP would remain average with that alternative. Where the existing visual quality category would be reduced one or more categories (from high to average, from high to low or from average to low), it was determined that an impact to visual quality would occur if the changes were seen by sensitive viewers. If the changes would not be seen by sensitive viewers, the reduction in visual quality was noted, as was the conclusion that the change would not produce a visual impact.

The assessments in this attachment were made by three senior landscape architects who conducted visual impact assessments. The group first rated the existing condition photographs of each KOP and assigned visual quality categories to each. The group then examined the simulations of the alternatives that were developed for each KOP and rated the view using the same rating criteria as was used to establish the existing visual quality category.

2 DUWAMISH SEGMENT

2.1 KOP WS-1 Highway 99 Viaduct SB Lane/Horton, Looking Southwest

2.1.1 Existing Condition

KOP WS1 is what travelers on southbound State Route 99 (a City of Seattle Designated Scenic Route) would see when looking southwest across the Duwamish Waterway toward West Seattle. This view is from the roadway and as such, would not be seen by sensitive viewers. This oblique view of the West Seattle Bridge (Figure 21a) has high average memorability or vividness because of the height of the bridge, partial view across the water, and view of the West Seattle hillsides in the distance. Vividness is also high average because the curved bridge form fits with the landform in the background. Utility structures and storage facilities are strong components of this KOP. The overall intactness is average because the marine-related uses are distinct from the forested hillside. Unity is low average because of the mix of uses. The quality of the view is average primarily because the bridge is a memorable landmark, the greenbelt is mostly intact, and the bridge form fits with the landform. However, the port terminal facility in the foreground provides competing elements with the bridge.

Figure 2-1a. KOP WS-1: Existing Condition

2.1.2 Summary of Visual Quality Changes, by Alternative

Table 2-1 compares the ratings for visual quality components in the existing condition at KOP WS-1 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 2-1. KOP WS-1 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred South Crossing Alternative (DUW-1a)	South Crossing South Edge Crossing Alignment Option (DUW-1b)	North Crossing Alternative (DUW-2)
Vividness	High Average	High Average	High Average	High Average
Intactness	Average	Low Average	Low Average	Low Average
Unity	Low Average	Low	Low Average	Low
Visual Quality	**Average**	**Low Average**	**Low Average**	**Low Average**

Note: All waterway crossing simulations depicted below indicate a balanced cantilever segmental box girder and a cable-stayed type bridge. Sound Transit is studying multiple bridge types, which are not shown.

2.1.2.1 Preferred South Crossing Alternative (DUW-1a)

The presence of the elevated guideway and cable-stayed structure would be dominant from this view along State Route 99 toward the West Seattle Bridge in the distance (Figure 2-1b). The vividness would remain high average due to the presence of the existing bridge, and the cable-stayed segment would visually emphasize the overall structure. The intactness would be reduced to low average, and the unity would be reduced to low due to the lack of unity between the bridges and the disrupted relationship to the greenbelt landscape in the background. The visual quality of the view would be reduced to low average but would not be a visual impact.

Figure 2-1b. KOP WS-1: Preferred Alternative DUW-1a

2.1.2.2 South Crossing South Edge Crossing Alignment Option (DUW-1b)

The presence of the elevated guideway and arching structure would be dominant from this view along State Route 99 toward the West Seattle Bridge in the distance (Figure 2-1c). The vividness would slightly reduce to high average due to the disparity between ascending and descending structural elements. The intactness would be reduced to low average, and the unity would be reduced to low average due to the lack of unity between the bridges and the competing components in the foreground, the disruption to the greenbelt in the background, and the increase in human-made elements. The visual quality of the view would be reduced to low average and would not be a visual impact.

Figure 2-1c. KOP WS-1: Option DUW-1b

2.1.2.3 North Crossing Alternative (DUW-2)

The presence of the elevated guideway and cantilever box girder structure would be dominant from this view along State Route 99 toward the West Seattle Bridge (Figure 2-1d). The vividness would remain as high average due to the memorability of the structure in the foreground and its dominance over the West Seattle Bridge in the background. The intactness would be reduced to low average because it encroaches on a view of the greenbelt. The unity would reduce to low due to the visual clutter and competing components in the foreground. The visual quality of the view would be reduced from average to low average but would not be a visual impact.

Figure 2-1d. KOP WS-1: Alternative DUW-2

2.2 KOP WS-2: West Seattle Bridge Westbound, Looking South

2.2.1 Existing Condition

KOP WS-2 was selected to depict views that people traveling on the West Seattle Bridge (a City of Seattle Designated Scenic Route) would see when looking south. This oblique view includes industrial lands and docks and piers along the Duwamish Waterway, the waterway itself, Boeing Field, and Mount Rainier, 57 miles to the south (Figure 2-2a). The memorability or vividness of this view is primarily dependent upon two factors: its elevation over a body of water and views of Mount Rainier. When Mount Rainer is visible on clear days, the vividness of the view is high, despite the industrial setting of the uplands and waterway. When Mount Rainier is not visible, foreground and middle ground views of industrial land uses decrease vividness. The mixture of industrial elements of varying sizes and appearances (including vapor plumes) creates a view with a low intactness even when Mount Rainier is visible. When visible, Mount Rainier's contrast with the industrial setting in the foreground and middle ground is high, and the unity of the view is less than when the mountain is not visible. The unity of the view is low average, as is the visual quality. This view is from the roadway and as such, would not be seen by sensitive viewers.

Figure 2-2a. KOP WS-2: Existing Condition

2.2.2 Summary of Visual Quality Changes, by Alternative Summary of Visual Quality Changes, by Alternative

Table 2-2 compares the ratings for visual quality components in the existing condition at KOP WS-2 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 2-2. KOP WS-2 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred South Crossing Algernative (DUW-1a)	South Crossing South Edge Crossing Alignment Option (DUW-1b)
Vividness	High	Low	Average
Intactness	Low	Low	Low
Unity	Low Average	Low	Low Average
Visual Quality	**Low Average**	**Low**	**Low Average**

Notes:

Alternative DUW-2 would not be seen from this view and therefore was not simulated or included in this table.

All waterway crossing simulations depicted below indicate a balanced cantilever segmental box girder or a cable-stayed type bridge. Sound Transit is studying multiple bridge types, all of which are not shown.

2.2.2.1 Preferred South Crossing Alternative (DUW-1a)

The nearby presence of the elevated guideway and trains would change the view to the south (Figure 2-2b) with Preferred Alternative DUW-1a. Most views to the south would be obscured, except for train users, and the ratings of vividness and unity of the visual quality components would be reduced to low, as would visual quality. This would be a visual impact.

Figure 2-2b. KOP WS-2: Preferred Alternative DUW-1a

2.2.2.2 South Crossing South Edge Crossing Alignment Option (DUW-1b)

The Duwamish Waterway would still be seen by travelers, but the elevated guideway for Option DUW-1b would encroach on views to the south of the waterway and industrial lands (Figure 2-2c*)*. The elevated guideway would encroach upon views of Mount Rainier at this elevation on the West Seattle Bridge. The high vividness of the existing view is achieved in part because it is all-encompassing. That panoramic view would be impeded by this alternative, except for train users, and the vividness would be reduced to from high to average. The low intactness would remain. From this location on the West Seattle Bridge, the low average unity of the view would not change. The visual quality of the view would remain low average. No visual impact would occur.

Figure 2-2c. KOP WS-2: Option DUW-1b

2.3 KOP WS-3: View from and Shoreline Habitat, Looking North

2.3.1 Existing Condition

KOP WS-3 was selected to depict views that visitors to t̓uʔəlaltxʷ Village Park and Shoreline Habitat would see when looking north across the Duwamish Waterway toward Harbor Island. The view includes the West Seattle Bridge, Duwamish Waterway, boat moorage, Harbor Marina Corporate Center at Terminal 102, and Terminal 18 gantry cranes (Figure 2-3a). The memorability or vividness of this view is the view across the water with recognizable downtown buildings that are partially obstructed in the background and the West Seattle Bridge. The quality of the view is average because the covered boat moorage and office building detract from the intactness and unity of the view.

Figure 2-3a. KOP WS-3: Existing Condition

2.3.2 Summary of Visual Quality Changes, by Alternative

Table 2-3 compares the ratings for visual quality components in the KOP WS-3 existing condition, with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 2-3. KOP WS-3 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred South Crossing Alternative (DUW-1a Cable-stayed Bridge)	Preferred South Crossing Alternative (DUW-1a Truss Bridge)	South Crossing South Edge Crossing Alignment Option (DUW-1b)	North Crossing Alternative (DUW-2)
Vividness	High Average	High	High	High	High Average
Intactness	Average	Average	Average	High Average	Average
Unity	Average	Low Average	Average	High Average	Average
Visual Quality	**Average**	**Average**	**Average**	**High Average**	**Average**

Note:

All waterway crossing simulations depicted below indicate a balanced cantilever segmental box girder, a cable-stayed, and a truss type bridge. Sound Transit is studying multiple bridge types, all of which are not shown.

2.3.2.1 Preferred South Crossing Alternative (DUW-1a), Cable-stayed Bridge

With Preferred Alternative DUW-1a, the visually dominant cable-stayed structure would create a dramatic and memorable change (Figure 2-3b). The vividness would increase slightly from a high average to a high rating for sensitive viewers, even with the presence of the existing boat moorage in the foreground. The intactness would remain average as the preferred alternative is considered another human-built element in the landscape and would maintain partially obstructed views to Downtown Seattle, of the boat moorage, and of the existing buildings in the foreground. The unity would be lowered slightly to low average due to the addition of another element adding to the complexity of the waterway view in the foreground. The visual quality would remain as average, which would not be a visual impact.

Figure 2-3b. KOP WS-3: Preferred Alternative DUW-1a, Cable-stayed Bridge

2.3.2.2 Preferred South Crossing Alternative (DUW-1a), Truss Bridge

With Preferred Alternative DUW-1a, the visually prominent truss structure would create a remarkable and memorable change (Figure 2-3c). The vividness rating would increase slightly from a high average to a high rating for sensitive viewers because the structure would align horizontally with the West Seattle Bridge. The intactness would remain average as the preferred alternative is considered another human-built element in the landscape and would maintain views to Downtown Seattle and the boat moorage in the foreground. The unity rating would remain average due to the truss structure consistent within the context of the working and recreational waterfront. The visual quality would remain as average, which would not be a visual impact.

Figure 2-3c. KOP WS-3: Preferred Alternative DUW-1a, Truss Bridge

2.3.2.3 South Crossing South Edge Crossing Alignment Option (DUW-1b)

With the structure's alignment being closer to sensitive viewers with Option DUW-1b, the light rail bridge structure would become more apparent (Figure 2-3d). Consequently, the vividness would increase slightly to high due to the height of the structure and larger presence in the landscape. The intactness and the unity would increase slightly due to the widely spaced guideway columns and the removal of the boat moorage in the waterway, thus balancing the view and providing an increased level of visual coherence. The visual quality would increase slightly from average to high average due to the slight increase in vividness, which would not be a visual impact.

Figure 2-3d. KOP WS-3: Option DUW-1b

2.3.2.4 North Crossing Alternative (DUW-2)

With Alternative DUW-2, the light rail bridge structure would align and merge with the horizontal profile of the existing West Seattle Bridge and maintain partial existing views of Downtown Seattle and foreground views of the boat moorage, existing buildings, and waterway (Figure 2-3e). This alternative would maintain the vividness rating of high average. Due to the alignment and the horizontal profile, most of the existing view would be maintained and Alternative DUW-2 would not affect intactness or unity levels. The visual quality would remain unchanged, which would not be a visual impact.

Figure 2-3e. KOP WS-3: Alternative DUW-2

2.4 KOP WS-4: Terminal 18 Park, Looking Southwest

2.4.1 Existing Condition

Terminal 18 Park is located along the Duwamish Waterway shoreline, with views of the waterway and West Seattle. The view from KOP WS-4 includes the West Seattle Bridge, a small part of a forested greenbelt, and nearby industrial land uses (Figure 2-4a). The primary visual elements in the view are the West Seattle Bridge, Duwamish Waterway, nearby industrial land uses, and utility structures. In the distance, the eastern slope of the Admiral District is also visible. The memorability or vividness of this view is high average and is primarily dependent on its view across the water; the West Seattle Bridge structure, which is vivid; and the foreground shoreline. The overall quality of the view is low average because the view lacks both unity and intactness of the visual integrity and coherence.

Figure 2-4a. KOP WS-4: Existing Condition

2.4.2 Summary of Visual Quality Changes, by Alternative

Table 2-4 compares the ratings for visual quality components in the existing condition at KOP WS-4 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 2-4. KOP WS-4 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred South Crossing Alternative (DUW-1a)	South Crossing South Edge Crossing Alignment Option (DUW-1b)
Vividness	High Average	Average	Average
Intactness	Low Average	Low	Low
Unity	Low Average	Low Average	Low
Visual Quality	**Low Average**	**Low Average**	**Low Average**

Note: Alternative DUW-2 would not be seen from this view. The alignment is above the viewer and therefore was not simulated or included in this table.

All waterway crossing simulations depicted below indicate a balanced cantilever segmental box girder type bridge. Sound Transit is studying multiple bridge types, which are not shown.

2.4.2.1 Preferred South Crossing Alternative (DUW-1a)

KOP WS-4 represents recreational sensitive viewers at Terminal 18 Park. The Preferred Alternative DUW-1a guideway would become another human-made element in the landscape (Figure 2-4b). The height and scale of the structure would be consistent with the existing West Seattle Bridge but obscure views to the greenbelt in the background and slightly lower the vividness from high average to average. The structure would add enough visual complexity to change the intactness to low. While the third elevated guideway (in addition to the West Seattle Bridge and the Spokane Street Bridge) would add to the unity, it would not be enough to offset the loss of the greenbelt views in the background. The visual quality of this alternative would remain as low average, which would not be a visual impact.

Figure 2-4b. KOP WS-4: Preferred Alternative DUW-1a

2.4.2.2 South Crossing South Edge Crossing Alignment Option (DUW-1b)

The Option DUW-1b guideway would become another human-made element in the landscape for recreational sensitive viewers at Terminal 18 Park (Figure 2-4c). The height of Option DUW-1b would be slightly lower than that of Preferred Alternative DUW-1a and would obscure more of the view to the greenbelt in the background, which would slightly lower the vividness from high average to average. The guideway structure would add enough additional visual complexity to change the intactness to low. While this third elevated guideway in the view would add to the unity, its lower vertical profile would increase the loss of the greenbelt views in the background compared to Preferred Alternative DUW-1a and would decrease to low. The visual quality of Option DUW-1b would be reduced to low average but not enough to be a visual impact.

Figure 2-4c. KOP WS-4: Option DUW-1b

2.5 KOP WS-5: West Seattle Bridge Westbound, Looking West toward Pigeon Point

2.5.1 Existing Condition

KOP WS5 was selected to represent views that people traveling on the West Seattle Bridge (a City of Seattle Designated Scenic Route) would see when looking west toward the northern extent of Pigeon Point and beyond. The primary visual elements in the view are the hillside greenbelt parkland that abuts the eastbound lane of the West Seattle Bridge (Figure 2-5a). The Admiral District neighborhood is visible in the distance. When both Pigeon Point and the hilltop neighborhood of Admiral District are visible, the vividness of the view is moderately high. The natural elements of the greenbelt create a higher degree of unity and intactness to the overall view; however, the appearance of a wide roadway and industrial uses through the otherwise residential West Seattle neighborhood would decrease the visual unity and intactness to low average. The visual quality of the existing view is average.

Figure 2-5a. KOP WS-5: Existing Condition

2.5.2 Summary of Visual Quality Changes, by Alternative

Table 2-5 compares the ratings for visual quality components in the existing condition with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 2-5. KOP WS-5 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred South Crossing Alternative (DUW-1a)	South Crossing South Edge Crossing Alignment Option (DUW-1b)	North Crossing Alternative (DUW-2)
Vividness	High Average	Average	Average	High Average
Intactness	Low Average	Low	Low	Low Average
Unity	Low Average	Low	Low	Low Average
Visual Quality	**Average**	**Low**	**Low**	**Average**

Note: Alternative DUW-2 would change the appearance of this area, but to a lesser degree than Preferred Alternative DUW-1a and Option DUW-1b and therefore was not simulated or included on this table.

2.5.2.1 Preferred South Crossing Alternative (DUW-1a)

KOP WS-5 represents a driver's perspective heading west into West Seattle on the West Seattle Bridge (Figure 2-5b). The introduction of retaining walls and the guideway under Preferred Alternative DUW-1a would interrupt the natural landform and forested hillside of Pigeon Point, which would reduce the distinctiveness of the landscape and vividness from high average to average. The addition of the retaining walls and guideway would become part of the transportation infrastructure in this area and decrease the intactness of the view to low. The relationship between the structures, the existing roadway, and the removal of vegetation would slightly reduce the compositional harmony (unity) between the existing forested landform to low. The visual quality would be reduced from average visual quality to low, which would be a visual impact.

Figure 2-5b. KOP WS-5: Preferred Alternative DUW-1a

2.5.2.2 South Crossing South Edge Crossing Alignment Option (DUW-1b)

The introduction of retaining walls and the guideway with Option DUW-1b would disrupt the natural landform and forested hillside of Pigeon Point, which would reduce the distinctiveness of the landscape and vividness from high average to average. The inclusion of the retaining walls and guideway curvature would become part of the encroachment of the transportation infrastructure, as shown in Figure 2-5c, and would decrease the intactness of the view to low. The relationship between the structures, the existing highway, and the removal of vegetation would slightly reduce the compositional harmony between the existing forested landform to low. The visual quality would be reduced from average visual quality to low, which would be considered a visual impact.

Figure 2-5c. KOP WS-5: Option DUW-1b

2.5.2.3 North Crossing Alternative (DUW-2)

Under Alternative DUW-2 the natural landform and vegetated hillside of Pigeon Point (Figure 2-5d) would be preserved; as such, the distinctiveness of the existing view would be maintained. As the alternative traverses the West Seattle Bridge, the guideway would create somewhat of a new gateway element into West Seattle, which would be a visual change. However, there would not be enough of a visual change to lower the existing vividness level (high average). The elevated alignment may be noticeable but blends in with the commercial and industrial background view near the lower portion of the West Seattle Bridge and maintains views to greenbelts and residential buildings; as such, the intactness and unity would also remain unchanged (from low average). The overall average visual quality would remain unchanged and is not considered a visual impact.

Figure 2-5d. KOP WS-5: Alternative DUW-2

2.6 KOP WS-6: Southwest Spokane Street/West Seattle Bridge Trail, Looking Southwest toward Mount Rainier

2.6.1 Existing Condition

KOP WS6 was selected to depict views that pedestrians and non-motorized traffic would see when traveling on the West Seattle Bridge Trail (a City of Seattle Designated Scenic Route). The view includes the West Seattle Bridge piers, Duwamish Waterway, nearby industrial land uses, and Mount Rainier, which is 57 miles to the south (Figure 2-6a). The memorability or vividness of this view is primarily high but is dependent on its elevation over water and views across the Duwamish River Valley toward Mount Rainier. When Mount Rainier is visible on clear days, the vividness of the view is high; the vividness is lower when the mountain is not visible. Due to the existing competing elements in the background, the intactness is high average and the unity of the view is average. The overall visual quality is high average.

Figure 2-6a. KOP WS-6: Existing Condition

2.6.2 Summary of Visual Quality Changes, by Alternative

Table 2-6 compares the ratings for visual quality components in the existing condition at KOP WS-6 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 2-6. KOP WS-6 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred South Crossing Alternative (DUW-1a, Cable-stayed Bridge)	Preferred South Crossing Alternative (DUW-1a, Truss Bridge)	South Crossing South Edge Crossing Alignment Option (DUW-1b)
Vividness	High	High Average	High Average	High Average
Intactness	High Average	Low	Low	Low
Unity	Average	Low Average	Low Average	Low Average
Visual Quality	**High Average**	**Low**	**Low**	**Low**

Note: Alternative DUW-2 would not be seen from this view and therefore was not simulated or included in this table.

All waterway crossing simulations depicted below indicate a balanced cantilever segmental box girder, a cable-stayed and truss type bridge. Sound Transit is studying multiple bridge types, which are not shown.

2.6.2.1 Preferred Alternative DUW-1a, Cable-stayed Bridge

Because of the elevation of the guideway structure over the waterway, the elevated, cable-stayed bridge under Preferred Alternative DUW-1a would maintain the City of Seattle Designated Scenic Route, along with pedestrian and bicyclist views toward the Duwamish Waterway and Mount Rainier in the distance (Figure 2-6b). Preferred Alternative DUW-1a with a cable-stayed bridge would maintain a high average level of vividness and become a positive aesthetic element in the landscape. The structure would interrupt the visual integrity of the view in the foreground and lower the intactness to low. The unity would be lowered to low average due to the lack of visual coherence within the viewshed. The visual quality of the view would be reduced from high average visual quality to low, which would be a visual impact.

Figure 2-6b. KOP WS-6: Preferred Alternative DUW-1a, Cable-stayed Bridge

2.6.2.2 Preferred South Crossing Alternative (DUW-1a), Truss Bridge

An elevated truss bridge under Preferred Alternative DUW-1a would maintain the City of Seattle Designated Scenic Route and the pedestrian and bicyclist views toward the Duwamish Waterway and Mount Rainier in the distance due to the elevation of the guideway structure over the waterway (Figure 2-6c). The truss bridge under this alternative would maintain a high level of vividness and becomes a positive aesthetic element in the landscape. The guideway structure would interrupt the visual integrity of the view in the foreground and lower the intactness to low. The unity would be slightly lowered to low average due to the lack of visual coherence within the viewshed. The visual quality of the view would be reduced from high average visual quality to low, which would be a visual impact.

Figure 2-6c. KOP WS-6: Preferred Alternative DUW-1a, Truss Bridge

2.6.2.3 South Crossing South Edge Crossing Alignment Option (DUW-1b)

The elevated balanced cantilever segmental box girder under Option DUW-1b would maintain the City of Seattle Designated Scenic Route and the pedestrian and bicyclist views toward the Duwamish Waterway and Mount Rainier in the distance due to the elevation of the guideway structure over the waterway (Figure 2-6d). The Option DUW-1b structure would slightly lower the high level of vividness to high average and become a positive aesthetic element in the landscape. The structure and guideway columns would interrupt the visual integrity of the view in the foreground and lower the intactness to low. The unity would be lowered to low average by the lack of visual coherence within the viewshed. The visual quality of the view would be reduced from high average visual quality to low, which would be a visual impact.

Figure 2-6d. KOP WS-6: Option DUW-1b

2.7 KOP WS-7: 17th Avenue Southwest, Looking North

2.7.1 Existing Condition

The view from KOP WS-7 represents what residents in this small residential neighborhood (Riverside) see when looking north toward Marginal Way Southwest and the West Seattle Bridge. The area beyond Marginal Way Southwest is industrial and commercial in use and character (Figure 2-7a). Utilitarian elements, which dominate this view, include the elevated West Seattle Bridge, the Spokane Street Bridge, and a tall electrical transmission line support structure. Utility lines and poles, single-family residences, and parked vehicles are prominent features in the foreground of this view. The West Seattle Bridge is the most noticeable element in this view, which has a high average degree of vividness. The bridge is also an intrusive element that, along with a mixture of visual elements such as residences, utilities lines, a large electric transmission line support structure, the 1st Avenue Bridge, and the surface of streets, results in a low degree of visual intactness. The view from this location is disjointed, which results in low visual unity. The visual quality of the view is low.

Figure 2-7a. KOP WS-7: Existing Condition

2.7.2 Summary of Visual Quality Changes, by Alternative

Table 2-7 compares the ratings for visual quality components in the existing condition at KOP W-7 with the ratings for each Duwamish Segment alternative. The visual changes related to each alternative are described in the following sections.

Table 2-7. KOP WS-7 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred South Crossing Alternative (DUW-1a)	South Crossing South Edge Crossing Alignment Option (DUW-1b)	North Crossing Alternative (DUW-2)
Vividness	High Average	High Average	Average	Average
Intactness	Low	Low	Low	Low
Unity	Low	Low	Low	Low
Visual Quality	**Low**	**Low**	**Low**	**Low**

Note:

All waterway crossing simulations depicted below indicate a cable-stayed or a balanced cantilever segmental box girder type bridge. Sound Transit is studying multiple bridge types, which are not shown.

2.7.2.1 Preferred South Crossing Alternative (DUW-1a)

With Preferred Alternative DUW-1a, the elevated guideway and support structure would be in front of the West Seattle Bridge and be very similar to its angle of descent (Figure 2-7b). The primary difference in the view is that with this alternative, passing trains would be clearly seen at a high elevation (although passing vehicles on the West Seattle Bridge can be seen to some degree). This alternative's presence would not result in a change of the views vividness, intactness, unity, or visual quality.

Figure 2-7b. KOP WS-7: Preferred Alternative DUW-1a

2.7.2.2 South Crossing South Edge Crossing Alignment Option (DUW-1b)

With Option DUW-1b, the elevated guideway and support structure would be closer to KOP WS-7 than would Preferred Alternative DUW-1a, and its angle of approach toward Pigeon Point would be different (Figure 2-7c*)*. The West Seattle Bridge would be visible "behind" the elevated guideway. The most noticeable difference between the existing view and the view with this alternative would be the addition of passing trains. The trains would be additional moving features to a view that currently includes vehicles traveling on the West Seattle Bridge, which would decrease the vividness of the view from high average to average. This alternative would not change the intactness, unity, or visual quality of the view, and there would not be a visual impact.

Figure 2-7c. KOP WS-7: Option DUW-1b

2.7.2.3 North Crossing Alternative (DUW-2)

The elevated guideway and support structure would be seen “behind and underneath” the West Seattle Bridge (Figure 2-7d) with Alternative DUW-2. The elevated guideway would add another visual element to the view and change the vividness from high average to average. However, it would not change the view’s low intactness, unity, or visual quality and would not be a visual impact.

Figure 2-7d. KOP WS-7: Alternative DUW-2

2.8 KOP WS-8: West Seattle Bridge Westbound, Looking North

2.8.1 Existing Condition

KOP WS-8 was selected to depict views that people traveling on the West Seattle Bridge (a City of Seattle Designated Scenic Route) would see when looking north (Figure 2-8a*)*. The view includes the west edge of Harbor Island, the Duwamish Waterway, the Industrial District West (Harbor Island), Elliott Bay, Queen Anne Hill, Magnolia, and a glimpse of the area north of Downtown Seattle (including the Space Needle). The view is somewhat memorable because of its elevation and views of the features mentioned previously. The mixture of different industrial elements in the foreground and middle ground, along with their utilitarian appearance, produce a low intactness. The unity of the view is consistent and low average. The visual quality of the view is low average. This view would not be seen by sensitive viewers.

Figure 2-8a. KOP WS-8: Existing Condition

2.8.2 Summary of Visual Quality Changes, by Alternative

Table 2-8 compares the ratings for visual quality components in the existing condition at KOP W-8 with the ratings for Alternative DUW-2, which is the only alternative that this view represents. The visual changes related to this alternative are described below.

Table 2-8. KOP WS-8 Visual Quality Changes by Alternative

Visual Quality Components	Existing	North Crossing Alternative (DUW-2)
Vividness	High Average	Low Average
Intactness	Low	Low
Unity	Low Average	Low Average
Visual Quality	**Low Average**	**Low Average**

Notes:

Preferred Alternative DUW-1a and Option DUW-1b would not be seen from this view and, therefore, were not simulated or included in this table.

All waterway crossing simulations depicted below indicate a balanced cantilever segmental box girder type bridge. Sound Transit is studying multiple bridge types, which are not shown.

2.8.2.1 North Crossing Alternative (DUW-2)

With Alternative DUW-2, the elevated guideway would be higher than the West Seattle Bridge elevation (Figure 2-8b*)*. The elevated guideway would encroach on the wide-open panoramic nature of the moving view and reduce its high average vividness to low average. The features of interest that are seen from the view would not be blocked by the elevated guideway. The guideway would be another element in this view that contains many different types of elements and would not alter the low intactness of the view. The vividness would be reduced from high average to low average, and the intactness would remain low. The visual unity of the view with the elevated guideway in place would remain low average, as would the visual quality, which would not be a visual impact.

Figure 2-8b. KOP WS-8: Alternative DUW-2

2.9 KOP WS-9: Looking North from Southwest Charlestown Street and 20th Avenue Southwest

2.9.1 Existing Condition

The view from KOP WS-9 represents the view to the north seen by residents in this neighborhood on Pigeon Point. The view extends over the edge of the West Duwamish Greenbelt and includes Elliott Bay, Queen Anne Hill, and the edge of Downtown Seattle (Figure 2-9a). The viewed area has a single-family residential character. The waters of Elliott Bay, Queen Anne Hill, and three tall orange Port of Seattle cranes on Harbor Island create a memorable and vivid view. Utility lines and poles encroach on the view to a degree and detract from its visual intactness, thus producing a rating of average. The unity of the view is high, as is the visual quality of the view.

Figure 2-9a. KOP WS-9: Existing Condition

2.9.2 Summary of Visual Quality Changes, by Alternative

Table 2-9 compares the ratings for visual quality components in the existing condition at KOP WS-9 with the ratings for each Duwamish Segment alternative. The visual changes related to each alternative are described in the following sections.

Table 2-9. KOP WS-9 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred South Crossing Alternative (DUW-1a)	South Crossing South Edge Crossing Alignment Option (DUW-1b)	North Crossing Alternative (DUW-2)
Vividness	High	High	High	High Average
Intactness	Average	Average	Average	Average
Unity	High	Average	Average	High Average
Visual Quality	**High**	**High Average**	**High Average**	**High Average**

Note: All waterway crossing simulations depicted below indicate a balanced cantilever segmental box girder type bridge. Sound Transit is studying multiple bridge types, which are not shown.

2.9.2.1 Preferred South Crossing Alternative (DUW-1a)

Construction of Preferred Alternative DUW-1a would require the removal of trees within and next to the West Duwamish Greenbelt as well as the removal of several residences (Figure 2-9b). The removal of these objects would open up distant views of more of Elliott Bay and Queen Anne Hill and would maintain or improve upon the high vividness of the view. The factors that contribute to an average degree of intactness (primarily the utility lines and poles) would remain, as would the average rating. The residential character of views to the north from remaining residences would change with the removal of residences. The lots where the residences would be removed would be used by Sound Transit for project support, and the character would change from residential to transportation (Figure 2-9b depicts the lots as cleared without support elements on them).
The replacement of residences with other uses would reduce the view's high degree of unity to average. The visual quality rating of the view would be reduced from high to high average, which is not enough of a reduction to be a visual impact.

Figure 2-9b. KOP WS-9: Preferred Alternative DUW-1a

2.9.2.2 South Crossing South Edge Crossing Alignment Option (DUW-1b)

This influence of Option DUW-1b on the visual quality of this view would be very similar to that of Preferred Alternative DUW-1a.

2.9.2.3 North Crossing Alternative (DUW-2)

This alternative's elevated guideway would be approximately 800 feet north of this location but would high enough that part of the elevated structure would be seen, as would passing trains (Figure 2-9c). Unlike Preferred Alternative DUW-1a and Option DUW-1b, vegetation in the West Duwamish Greenbelt next to this location would not be removed. Passing trains and the elevated guideway would slightly lower the vividness and unity rating and would slightly reduce the visual quality rating from high to high average, which would not be enough of a reduction to be a visual impact.

Figure 2-9c. KOP WS-9: Alternative DUW-2

2.10 KOP WS-10: West Seattle Bridge Eastbound Lane, 300 Feet West of 23rd Avenue Southwest Right-of-Way, Looking Southeast

2.10.1 Existing Condition

KOP WS-10 looks out over an area identified as a City of Seattle, Scenic Route Corridor. The view represents a driver's perspective heading east on the West Seattle Bridge.

Primary elements of the view include the northern extent of Pigeon Point below (Figure 2-10a). The scene is a juxtaposition of residences on a forested hillside that is a prominent landform and the lower West Duwamish Greenbelt. The vividness is rated as high average due to the recognizable forested hillside for viewers heading east from West Seattle. Intactness is average because of the bridge and ramp in the foreground. Likewise, unity is average only because of the mix of land uses, which are predominantly transportation-related in the foreground view. The existing visual quality is average.

Figure 2-10a. KOP WS-10: Existing Condition

2.10.2 Summary of Visual Quality Changes, by Alternative

Table 2-10 compares the ratings for visual quality components in the existing condition at KOP WS-10 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 2-10. KOP WS-10 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred South Crossing Alternative (DUW-1a)	South Crossing South Edge Crossing Alignment Option (DUW-1b)
Vividness	High Average	Average	Average
Intactness	Average	Low	Low
Unity	Average	Low	Low
Visual Quality	**Average**	**Low**	**Low**

Note: Alternative DUW-2 would not be seen from this view. The alignment would be above the viewer and frame of this photo and therefore was not simulated or included in this table.

2.10.2.1 Preferred South Crossing Alternative (DUW-1a)

The introduction of retaining walls and the guideway under Preferred Alternative DUW-1a would disrupt the natural landform and forested hillside of Pigeon Point, which would reduce the distinctiveness of the landscape and vividness from high average to average (Figure 2-10b). The new retaining walls and guideway would become part of the transportation system and, due to the impact on the natural hillside, the intactness would be reduced to low. The relationship between the new structures, the existing highway, and the removal of vegetation would slightly reduce the compositional harmony of the existing forested landform to low. Therefore, the visual quality would be reduced from average to low, which would be considered a visual impact.

Figure 2-10b. KOP WS-10: Preferred Alternative DUW-1a

2.10.2.2 South Crossing South Edge Crossing Alignment Option (DUW-1b)

The KOP WS-10 view under Option DUW-1b would be very similar to Preferred Alternative DUW-1a (Figure 2-10c). The introduction of retaining walls and the guideway in the foreground would replace the natural landform and forested hillside of Pigeon Point; this would reduce the distinctiveness of the landscape and vividness from high average to average. The inclusion of the retaining walls and guideway would become part of the overall transportation system, but due to the impact on the natural hillside, the intactness would downgrade to low. While the removal of existing vegetation could increase northerly views from the existing residences at the top of Pigeon Point, the relationship between the structures, the existing highway, and the removal of vegetation from this view would slightly reduce the compositional harmony of the existing forested landform to low. The visual quality would be reduced from average to low, which would be a visual impact.

Figure 2-10c. KOP WS-10: Option DUW-1b

This page is intentionally left blank.

3 DELRIDGE SEGMENT

3.1 KOP WS-11: Looking West along Southwest Andover Street toward Delridge Way Southwest

3.1.1 Existing Condition

KOP WS11 was selected to depict views of the guideway that residential sensitive viewers on Southwest Andover Street might see when looking west toward Delridge Way Southwest. The vividness of this view is enhanced by the unobstructed sightline across the valley to the hillside residences (Figure 3-1a). The character of the surrounding area is a mix of commercial and residential land uses with some dense urban canopy. Overall, this view has an average level of vividness because this is a common view of West Seattle. The intactness and unity are also average because of the mix of land uses, including strip retail. The overall existing visual quality is average.

Figure 3-1a. KOP WS-11: Existing Condition

3.1.2 Summary of Visual Quality Changes, by Alternative

Table 3-1 compares the ratings for visual quality components in the existing condition at KOP WS-11 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-1. KOP WS-11 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	Dakota Street Station Alternative (DEL-1a)	Dakota Street Station Lower Height Alternative (DEL-2a)	Delridge Way Station Alternative (DEL-3)	Andover Street Station Lower Height Alternative (DEL-6a)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)
Vividness	Average	High	Average	Average	Average	High Average	High
Intactness	Average	Average	High Average	Low	High Average	Average	Average
Unity	Average	High Average	Average	Low Average	Average	Low Average	High Average
Visual Quality	**Average**	**High Average**	**Average**	**Low**	**Average**	**Average**	**High Average**

Note: Alternative DEL-7 would be the same as Preferred Option DEL-6b and therefore was not simulated. Option DEL-1b, Option DEL-2b, Alternative DEL-4, and Alternative DEL-5 would change the appearance of this area, but to a lesser degree than Preferred Option DEL-6b, Alternative DEL-6a, and Alternative DEL-7 and therefore were not simulated or included on this table.

3.1.2.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

With Preferred Option DEL-6b, the lower height guideway would place more emphasis on the station area in the foreground and would be very visible from KOP WS-11 (Figure 3-1b). The view of the station in the foreground would strengthen the focal point with a similar bulk and scale as the existing retail center and increase the vividness to high. The intactness would remain as average as existing conditions because this option would not alter the integrity of the neighborhood and views to the topography and vegetation in the background. The unity would slightly increase the visual coherence because the station would replace the existing retail center and maintain the existing residential and commercial character. The visual quality would slightly increase from average to high average, which is not considered a visual impact.

Figure 3-1b. KOP WS-11: Preferred Option DEL-6b

3.1.2.2 Dakota Street Station Alternative (DEL-1a)

The elevated guideway and straddle bent piers would remove the existing strip retail building at the northwest corner of Southwest Andover Way and Delridge Way Southwest, which would allow views of the remaining business park buildings. Views of the trees and homes on the hillside in the background would be maintained (Figure 3-1c). The vividness would not change (from average). The removal of the existing building would enhance the integrity of the view while slightly increasing the intactness from average to high average. Visual unity would slightly decrease due to the introduction of a new transportation element but not enough to lower the existing average unity. The overall visual quality would remain average and there would not be a visual impact.

Figure 3-1c. KOP WS-11: Alternative DEL-1a

3.1.2.3 Dakota Street Station Lower Height Alternative (DEL-2a)

With Alternative DEL-2a, the lower height elevated guideway and the straddle beam columns would be in close proximity to the viewer and would add an increased degree of drama which would slightly increase the vividness but would remain average. With the removal of the existing building on the northeast corner of Delridge Way Southwest and Southwest Andover Street, the integrity of the view to the business park would slightly increase but remain intact. However, the background view to the residential neighborhood (Figure 3-1d) would be diminished and would lower the intactness from average to low. The encroachment of a new transportation element at a lower height would be more apparent to the viewer and would slightly lower the average unity to low average. The visual quality would be lowered from average to low and would be considered a visual impact.

Figure 3-1d. KOP WS-11: Alternative DEL-2a

3.1.2.4 Delridge Way Station Alternative (DEL-3)

Similar to Alternative DEL-1a (Figure 3-1c), the elevated alignment and straddle bent piers would remove the existing retail building at the northwest corner of Southwest Andover Street and Delridge Way Southwest, which would expose additional views of the business park on the west side of Delridge Way Southwest. This alternative would maintain views of the trees and homes on the hillside in the background (Figure 3-1e). The vividness would not change (from average). The removal of the existing building would enhance the integrity of the view while slightly increasing the intactness from average to high average. Visual unity would slightly decrease due to the introduction of a new transportation element but not enough to lower the existing average unity. The overall visual quality would remain average and there would not be a visual impact.

Figure 3-1e. KOP WS-11: Alternative DEL-3

3.1.2.5 Andover Street Station Lower Height Alternative (DEL-6a)

With Alternative DEL-6a, the elevated guideway, which would curve and ascend through the neighborhood, would be very visible from this location and slightly increase the degree of drama and vividness to high average while maintaining the rise in topography and existing vegetation in the background (Figure 3-1f). The station in the foreground reflects a very similar height, bulk and scale as the existing retail strip center and would not be out of character or change the intactness. The unity would slightly decrease to low average due to the exposure of the large industrial building and the addition of a new transportation facility element that is out of residential and commercial visual character of the neighborhood. The average visual quality would not change and is not a visual impact.

Figure 3-1f. KOP WS-11: Alternative DEL-6a

3.1.2.6 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

The influence of Alternative DEL-7 on the visual quality of this view would be similar to that of Preferred Option DEL-6b (Figure 3-1b). The visual quality of the view would slightly increase from average to high average which would not be a visual impact.

3.2 KOP WS-12: Looking North Along Delridge Way Southwest

3.2.1 Existing Condition

KOP WS-12 was selected to represent views to the north along Delridge Way Southwest that are seen along Delridge Way by residents. The view extends beyond Delridge Way Southwest and includes Queen Anne Hill and a glimpse of Elliott Bay (Figure 3-2a). This part of Delridge Way Southwest has a primarily residential character, although commercial buildings can be seen in the middle ground and industrial areas can be glimpsed beyond the visual terminus of the street. The primary visual elements in the view are the street, single-family and multi-family buildings, plus utility lines and poles. Distant views of Queen Anne and Elliott Bay rate the view a high average of vividness. The pleasant streetscape contains street trees and adjacent landscaping, which contributes to average visual intactness. The visual pattern of the streetscape and adjacent areas is somewhat coherent, so the unity is average. The visual quality of the view is average.

Figure 3-2a. KOP WS-12: Existing Condition

3.2.2 Summary of Visual Quality Changes, by Alternative

Table 3-2 compares the ratings for visual quality components in the existing condition at KOP WS-12 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-2. KOP WS-12 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	Dakota Street Station (DEL-1a)	Dakota Street Station North Alignment Option (DEL-1b)	Dakota Street Station Lower Height (DEL-2a)	Dakota Street Station Lower Height North Alignment Option (DEL-2b)	Delridge Way Station (DEL-3)	Delridge Way Station Lower Height (DEL-4)	Andover Street Station (DEL-5)	Andover Street Station Lower Height (DEL-6a)	Andover Street Station Lower Height No Avalon Station Tunnel Connection (DEL-7)
Vividness	High Average	Average	Average	Average	Low Average	Average	Average	Average	Average	Average	Average
Intactness	Average	Average	Low	Low	Low	Low	Low	Low	Average	Average	Average
Unity	Average	Low Average	Low	Low	Low	Low	Low	Low	Low Average	Low Average	Low Average
Visual Quality	**Average**	**Average**	**Low**	**Low**	**Low**	**Low**	**Low**	**Low**	**Average**	**Average**	**Average**

Note:

Preferred Option DEL-6b and Alternative DEL-7 were not simulated because they are the same as Alternative DEL-6a. Option DEL-2b was not simulated because, from this view, it would be like Alternative DEL-1a.

3.2.2.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

The influence of Preferred Option DEL-6b on the visual quality of this view would be similar to that of Alternative DEL-6a (see Figure 3-2g below in Section 3.2.2.9). The visual quality of the view would remain average which would not be a visual impact.

3.2.2.2 Dakota Street Station Alternative (DEL-1a)

With Alternative DEL-1a, the elevated guideway would be located along Delridge Way Southwest and cross over the street approaching the elevated Delridge Station (the edge of which would be seen as shown in Figure 3-2b). This alternative would require the removal of single-family residences along Delridge Way Southwest, which would detract from the residential character this part of the neighborhood. The elevated guideway structure over Delridge Way Southwest would be highly visible from this location and could appear visually incompatible in a residential neighborhood.

Views toward Elliott Bay and Queen Anne Hill would be framed by straddle bents over Delridge Way Southwest. The vividness of this view would change from high average to average. The height, bulk, scale, and form of the elevated guideway would be a visual encroachment and reduce intactness from average to low. Visual connections to Elliott Bay and Queen Anne Hill would somewhat remain. However, the curve of the alignment would not follow the street grid of this area and thus inconsistent with the street pattern and consequently diminish visual coherence. Likewise, the unity rating would be reduced to low. The overall visual quality would be lowered from average to low, which would be a visual impact.

Figure 3-2b. KOP WS-12: Alternative DEL-1a

3.2.2.3 Dakota Street Station North Alignment Option (DEL-1b)

The influence of Option DEL-1b on the visual quality of this view, as shown on Figure 3-2c, would be very similar to Alternative DEL-1a. The visual quality would be lowered from average to low, which would be a visual impact.

Figure 3-2c. KOP WS-12: Option DEL-1b

3.2.2.4 Dakota Street Station Lower Height Alternative (DEL-2a)

The elevated guideway with Alternative DEL-2a would intrude upon views to the north of areas along Delridge Way Southwest, Elliott Bay, and Queen Anne Hill (see Figure 3-2d). The high average vividness of this view would be decreased to low average without views of Elliott Bay and Queen Anne Hill. The location, height, bulk, scale, form, and color of the elevated guideway would be a visual encroachment on this location, thus reducing intactness from average to low. Because the curved alignment would not provide a visual coherence with the street grid, the unity rating would be reduced from average to low. The visual quality would be lowered from average to low, which would be a visual impact.

Figure 3-2d. KOP WS-12: Alternative DEL-2a

3.2.2.5 Dakota Street Station Lower Height North Alignment Option (DEL-2b)

The influence of Option DEL-2b on the visual quality of the view from KOP WS-12 would be very similar to Alternative DEL-2a, as shown on Figure 3-2d. The visual quality would be lowered from average to low, which would be a visual impact.

3.2.2.6 Delridge Way Station Alternative (DEL-3)

The elevated guideway's wide straddle bents with Alternative DEL-3 would follow both sides of Delridge Way Southwest when viewed from KOP WS-12 and would dominate the views to the north (Figure 3-2e). The tunnel-like appearance of the guideway over Delridge Way Southwest would be unique and vivid, but these qualities would be reduced from average to low and high average to low, respectively. This alternative's structures would introduce multiple large-scale elements into the view that would be very different in height, bulk, scale, form, and color compared to existing visual elements. With this alternative, the overhead utility lines would be underground due to the station crossing over Delridge Way Southwest but would not alter the overall visual quality. The intactness of the view down Delridge Way Southwest would be reduced from average to low. The visual pattern of this part of Delridge Way Southwest would be less visually coherent with this alternative than it is currently, and the unity would be reduced from average to low. The visual quality of the view would be reduced from average to low, which would be a visual impact.

Figure 3-2e. KOP WS-12: Alternative DEL-3

3.2.2.7 Delridge Way Station Lower Height Alternative (DEL-4)

From this location, Alternative DEL-4 would be very similar in appearance to Alternative DEL-3 depicted in Figures 3-2d and 3-2e, as would its influence on visual quality. The visual quality of the view would be reduced from average to low, which would be a visual impact.

3.2.2.8 Andover Street Station Alternative (DEL-5)

Alternative 5 would place the elevated guideway at the end of Delridge Way Southwest but would not require the removal of buildings in the foreground of this view (Figure 3-2f). The primary change to the view would be the elevated guideway and station crossing over Delridge Way Southwest, impairing distant views of Elliott Bay and Queen Anne Hill and reducing the high average vividness of the view to average. The guideway and station would introduce new elements into the view, but they would be far enough away so their presence would not alter existing intactness or unity, but the vividness would change from high average to average. The visual quality of the view would remain average, which would not be a visual impact.

Figure 3-2f. KOP WS-12: Alternative DEL-5

3.2.2.9 Andover Street Station Lower Height Alternative (DEL-6a)

The appearance of Alternative DEL-6a would be very similar to that of Alternative DEL-5. However, because this alternative would be farther north on Delridge Way Southwest, the guideway would have less impact on distant views of Queen Anne Hill (Figure 3-2g). All the existing ratings of the visual quality components and visual quality would be the same as with Alternative DEL-5 and would reduce the high average vividness from high average to average, but all other visual components would remain the same. The visual quality would remain average, which would not be a visual impact.

Figure 3-2g. KOP WS-12: Alternative DEL-6a

3.2.2.10 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

The influence of Alternative DEL-7 on the visual quality of this view would be similar to that of Alternative DEL-6a (Figure 3-2g). The visual quality of the view would remain average which would not be a visual impact.

3.3 KOP WS-13: Looking Northwest from Delridge Playfield

3.3.1 Existing Condition

KOP WS-13 is a place within the Delridge Playfield (much of which is a traditional park) where park users looking north/northwest have relatively unobstructed territorial views (Figure 3-3a). The character of the view is a combination of parklands and residential neighborhood. Trees within the park and beyond are major visual elements that partially obstruct views of residences and utility lines and poles beyond them. This open view in a heavily developed area with views of the distant hill has a high degree of vividness. The pleasant park and residential settings of the view also have high average visual intactness. The unity of the view is high, as is its visual quality.

Figure 3-3a. KOP WS-13: Existing Condition

3.3.2 Summary of Visual Quality Changes, by Alternative

Table 3-3 compares the ratings for visual quality components in the existing condition at KOP WS-13 with the ratings for each alternative. The visual changes related to each alternative are described in the following subsections.

Table 3-3. KOP WS-13 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Dakota Street Station Altnerative (DEL-1a)	Dakota Street Station North Alignment Option (DEL-1b)	Dakota Street Station Lower Height Alternative (DEL-2a)	Dakota Street Station Lower Height North Alignment Option (DEL-2b)	Delridge Way Station Alternative (DEL-3)	Delridge Way Station Lower Height Alternative (DEL-4)
Vividness	High	High	High	Average	Average	High	Average
Intactness	High Average	Low	Low	Low	Low	Low	Low
Unity	High	Low Average	Low Average	Average	Average	Low Average	Average
Visual Quality	**High**	**Low Average**	**Low Average**	**Average**	**Average**	**Low Average**	**Average**

Note:

Preferred Option DEL-6b, Alternative DEL-5, Alternative DEL-6a, and Alternative DEL-7 would not be seen from this view and, therefore, were not simulated or included in this table.

3.3.2.1 Dakota Street Station Alternative (DEL-1a)

With Alternative DEL-1a, the elevated guideway and support structures would be very visible from this location. This alternative would be located outside the Delridge Playfield, but would influence the viewed landscape beyond (Figure 3-3b). The vividness or memorability of the view with the elevated guideway structure would remain high. The scale, form color, and materials of this alternative's components would encroach on the viewed landscape and introduce a new, major transportation facility element into a view that is currently residential and park-like. The vertical alignment of the guideway would be above the horizon line. With these changes, the intactness of the view would be reduced from high average to low. The visual connection with the far hillside would be maintained by the elevated guideway, but the visual pattern of the view would change. The unity of the view would be reduced from high to low average. The visual quality of the view would be reduced from high to low average, which would be a visual impact.

Figure 3-3b. KOP WS-13: Alternative DEL-1a

3.3.2.2 Dakota Street Station North Alignment Option (DEL-1b)

The influence of Option DEL-1b on the visual quality of this view would be very similar to that of Alternative DEL-1a in that the structure and guideway columns would be visible. The vividness or memorability of the view with the elevated guideway structures would remain high. However, the intactness of the view would be reduced from high average to low due to the encroachment of the neighborhood and park character. The visual pattern of the view would be interrupted and reduce the unity from high to low average. The visual quality of the view would be reduced from high to low average, which would be a visual impact.

3.3.2.3 Dakota Street Station Lower Height Alternative (DEL-2a)

Portions of the elevated guideway would be visible from this location (Figure 3-3c) with Alternative DEL-2a. This alternative would be outside of the Delridge Playfield, but the viewed landscape (particularly the residential area across Southwest Genesee Street) would be influenced by it. From this viewing location, the elevated guideway would be similar in appearance to a typical roadway overpass unless trains were visible. The vividness of the view would be reduced from high to average. The strong horizontal form, color, materials, and scale of the elevated guideway would encroach on the viewed landscape and introduce a major transportation facility element into an area that is otherwise residential and park-like in character. It would reduce the intactness from high average to low. The alignment of this alternative as it would pass from Fauntleroy Way Southwest to Southwest Genesee Street would not follow the grid pattern of nearby streets. This would change the visual pattern and coherence of the viewed area and reduce the unity rating from high to average. The visual quality of the view would be reduced from high to average, which would be a visual impact.

Figure 3-3c. KOP WS-13: Alternative DEL-2a

3.3.2.4 Dakota Street Station Lower Height North Alignment Option (DEL-2b)

From this location, the Option DEL-2b elevated guideway would be very similar in appearance to the Alternative DEL-2a elevated guideway. The visual quality of the view would be reduced from high to average, which would be a visual impact.

3.3.2.5 Delridge Way Station Alternative (DEL-3)

The Alternative DEL-3 elevated guideway would be highly visible from this location (Figure 3-3d). It would create less visual change to the portion of the neighborhood across the street from the Delridge Playfield seen from this location than would the other alternatives along Southwest Genesee Street. However, this alternative would be closer to this location than the other alternatives. The memorability or vividness of the view with the elevated guideway and support structures would remain high. The location, scale, form, color, and materials of the elevated guideway and columns would encroach into the viewed landscape and introduce a major transportation facility element into the view, which would reduce the intactness rating from high average to low. The elevated guideway would not follow the existing street pattern and would be above the horizon from this observation point. The existing high unity would be reduced to low average. The visual quality of the view would be lowered from high to low average, which would be a visual impact.

Figure 3-3d. KOP WS-13: Alternative DEL-3

3.3.2.6 Delridge Way Station Lower Height Alternative (DEL-4)

Alternative DEL-4 would be closer to this observation point than Alternative DEL-2a, and its elevated guideway would be somewhat higher (Figure 3-3e). The influence of this alternative on vividness, intactness, and unity would be like that of Alternative DEL-2a, as would the influence on visual quality. Although the elevation of the guideway would preserve views of the neighborhood, the scale and height of the guideway would offset that benefit because it would be visually imposing. The vividness and unity would be reduced from high to average. The intactness would be reduced from high average to low, and the visual quality of the view would be reduced from high to average, which would be a visual impact.

Figure 3-3e. KOP WS-13: Alternative DEL-4

3.4 KOP WS-14: Looking North along 26th Avenue Southwest

3.4.1 Existing Condition

KOP WS-14 was selected to depict views that residents see when looking north along 26th Avenue Southwest. The view is of a residential neighborhood, with multi-story, multi-family buildings on the east side of the street and lower density residential on the west side of the street (Figure 3-4a). The vividness of this view is maintained by the unobstructed sightline across the valley to the hilltop neighborhood of Queen Anne in the background. The character of the surrounding area is a mix of commercial and residential with a densely planted urban canopy. Overall, this view has a moderately high degree of unity and intactness, a high degree of vividness, and an average level of encroaching elements. Visual quality overall is average because it is a common view in West Seattle. In the immediate area, unity is high average because of the strong architectural presence of the newer multi-family buildings.

Figure 3-4a. KOP WS-14: Existing Condition

3.4.2 Summary of Visual Quality Changes, by Alternative

Table 3-4 compares the ratings for visual quality components in the existing condition at KOP WS-14 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-4. KOP WS-14 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	Andover Street Station Alternative (DEL-5)	Andover Street Station Lower Height Alternative (DEL-6a)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)
Vividness	Average	Average	High Average	High Average	Average
Intactness	Average	Average	Average	Average	Average
Unity	High Average	High Average	High Average	High Average	High Average
Visual Quality	**Average**	**Average**	**High Average**	**High Average**	**Average**

Note: Alternative DEL-5 would be the same as Alternative DEL-6a from this view, and Alternative DEL-7 would be the same as Preferred Option DEL-6b; therefore, these alternatives were not simulated.

3.4.2.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

The view of Preferred Option DEL-6b indicates a lower height guideway (Figure 3-4b). This view would primarily be seen by sensitive residential viewers. With the Lower Height Alternative, the existing vegetation would be removed and provide partial views to the West Seattle Bridge and limited views to Elliott Bay, which would maintain the average vividness from this viewpoint. The height and scale of the guideway would be consistent with adjacent multi-family buildings. However, the guideway would partially obscure views of Queen Anne Hill but not enough to lower the intactness rating, which would remain average. The unity rating would also increase slightly to high average because the guideway would be narrowly framed by buildings and vegetation, with a similar height and scale. The visual quality would remain as average, which would not be a visual impact.

Figure 3-4b. KOP WS-14: Preferred Option DEL-6b

3.4.2.2 Andover Street Station Alternative (DEL-5)

The influence of Alternative DEL-5 on the visual quality of this view would primarily be seen by residential sensitive viewers. The existing vegetation would be removed and provide views to the West Seattle Bridge and partial views to Elliott Bay, which would slightly increase the vividness from this viewpoint (Figure 3-4c). The height and scale of the guideway is consistent with the adjacent multi-family buildings. The guideway would partially obscure views of Queen Anne Hill in the background but not enough to lower the intactness, which would remain average. The unity would also remain high average due to the guideway being narrowly framed by buildings and vegetation. The visual quality of the view would be an increase from average to high average, which would be a slight visual benefit.

3.4.2.3 Andover Street Station Lower Height Alternative (DEL-6a)

The influence of Alternative DEL-6a on the visual quality of this view would be similar to that of Alternative DEL-5 (see Figure 3-4c).The visual quality would slightly increase from average to high average and would not be a visual impact.

Figure 3-4c. KOP WS-14: Alternative DEL-6a

3.4.2.4 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

The influence of Alternative DEL-7 on the visual quality of this view would be similar to that of Preferred Option DEL-6b (Figure 3-4b). The visual quality of the view would remain average, which would not be a visual impact.

3.5 KOP WS-15: Looking West along Southwest Genesee Street from near Longfellow Creek

3.5.1 Existing Condition

KOP WS15 represents the view to the west seen by residents along this portion of Southwest Genesee Street as well as by people accessing the Longfellow Creek Legacy Trail from Southwest Genesee Street. The view from KOP WS15 includes Longfellow Creek Natural Area to the north (right), the edge of the West Seattle Golf Course to the south (left), and the slope up to Southwest Avalon Way. Residences (single-family and multi-family) can be seen along the north side of Southwest Genesee Street beyond the Longfellow Creek Natural Area (Figure 3-5a). Trees in the Longfellow Creek Natural Area and along the south side of Southwest Genesee Street (next to the West Seattle Golf Course) are dominant visual elements of the view and lend a natural character to part of the view. The north side of Southwest Genesee Street beyond the Longfellow Creek Natural Area has a residential character. The vividness, intactness, and unity of the existing view is high average, due in large part to the presence of large trees on either side of the road. The visual quality of the view is also high average.

Figure 3-5a. KOP WS-15: Existing Condition

3.5.2 Summary of Visual Quality Changes, by Alternative

Table 3-5 compares the ratings for visual quality components in the existing condition at KOP WS-15 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-5. KOP WS-15 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Dakota Street Station Alternative (DEL-1a)	Dakota Street Station North Alignment Option (DEL-1b)	Dakota Street Station Lower Height Alternative (DEL-2a)	Dakota Street Station Lower Height North Alignment Option (DEL-2b)	Delridge Way Station Alternative (DEL-3)	Delridge Way Station Lower Height Alternative (DEL-4)
Vividness	High Average	Low Average	Low Average	Average	Low Average	Low Average	Average
Intactness	High Average	Low	Low	Low	Low	Low	Low
Unity	High Average	Low	Low	Low Average	Low	Low	Low Average
Visual Quality	**High Average**	**Low**	**Low**	**Low Average**	**Low**	**Low**	**Low Average**

Note:

Preferred Option DEL-6b, Alternative DEL-5, Alternative DEL-6a, and Alternative DEL-7 would not be seen from this view and therefore were not simulated or included in this table.

3.5.2.1 Dakota Street Station Alternative (DEL-1a)

Trees at the edge of the Longfellow Creek Natural Area next to Southwest Genesee Street would be cleared with Alternative DEL-1a, but most of the clearing (trees and residences) along the north (right) side of the street would occur farther west (Figure 3-5b). Large trees that line the south side of Southwest Genesee Street and screen views into (and out of) the West Seattle Golf Course would be removed. The existing overhead utilities on the north side of Southwest Genesee Street would shift farther to the north but would not alter the visual quality. The presence of the elevated guideway columns and overhead elevated guideway along the south side of this view would introduce large-scale transportation elements into this view. The visually distinctive and vivid trees would be removed, and vividness would decrease from high average to low average. The guideway columns and elevated guideway would add new human-made objects to this view that would differ in scale, form, color, and materials with existing visual elements and would encroach on the view to the west (but not block it) toward the top of Southwest Genesee Street. The intactness of the view would be reduced from high average to low due to the removal of trees. The high average unity of the view would decrease to low with the removal of the important visual elements in the view (trees and residences) that currently help establish a harmonious visual pattern. The visual quality of the view from this location would be reduced from high average to low, which would be a visual impact.

Figure 3-5b. KOP WS-15: Alternative DEL-1a

3.5.2.2 Dakota Street Station North Alignment Option (DEL-1b)

Option DEL-1b would change the visual character of this view from natural and residential to transportation (Figure 3-5c). The appearance of the view to the west would perhaps best be described as that found underneath an overpass structure (but would not be as wide). Trees next to the Longfellow Creek Natural Area would be removed, as would trees and residences farther west along the north side of Southwest Genesee Street. The existing overhead utilities on the north side of Southwest Genesee Street would shift farther to the north but would not alter the visual quality. Trees along the south side of Southwest Genesee Street and part of the West Seattle Golf Course would also be removed. The replacement of trees and residences with a series of tall guideway columns (that would be somewhat memorable due to their scale) would reduce the vividness of the view to low average. The existing high average intactness and unity of the view would be reduced to low with the alternative's components, as would visual quality, which would be a visual impact.

Figure 3-5c. KOP WS-15: Option DEL-1b

3.5.2.3 Dakota Street Station Lower Height Alternative (DEL-2a)

Alternative DEL-2a components would only be seen on the south side of Southwest Genesee Street (Figure3-5d) from this location. The north side of the street's visual condition would not change. The large trees that line the south side of Southwest Genesee Street and screen views into and out of the West Seattle Golf Course would be removed, and the north end of the golf course would need to be redesigned. The presence of the golf course netting and support poles would be noticeable but would not reduce the visual quality. The presence of the single row of columns and overhead guideway heading to the tunnel portal would introduce large-scale elements into this view but would not block views to the top of Southwest Genesee Street. The overhead structures and the tunnel portal would be memorable, but the vividness of the view would change to average. The location, scale, form, and color of the elevated structure would be a visual encroachment on this location, which would reduce the intactness of the view. These new visual elements and removal of trees would reduce the existing high average intactness of the view to low. The single row of guideway columns and elevated guideway heading to the tunnel portal would establish a somewhat coherent pattern in the view, so despite the removal of trees south of Southwest Genesee Street, unity would be reduced to low average rather than low. The visual quality of the view would be reduced from high average to low average, which not be a visual impact from this location.

Figure 3-5d. KOP WS-15: Alternative DEL-2a

3.5.2.4 Dakota Street Station Lower Height North Alignment Option (DEL-2b)

Option DEL-2b would pass over and along Southwest Genesee Street, and its straddle bents would dominate the view and change the visual character of this area from natural and residential to transportation (Figure3-5e). The appearance of the view to the west would perhaps best be described as that found underneath an overpass structure (but would not be as wide). Trees next to the Longfellow Creek Natural Area would be removed, as would trees and residences farther west along the north side of Southwest Genesee Street. Trees along the south side of Southwest Genesee Street and part of the West Seattle Golf Course would also be removed. The replacement of trees and residences with a series of tall guideway columns (that would be somewhat memorable due to their scale) would reduce the vividness of the view to low average. The existing high average intactness and unity of the view would be reduced to low, as would visual quality, which would be a visual impact.

Figure 3-5e. KOP WS-15: Option DEL-2b

3.5.2.5 Delridge Way Station Alternative (DEL-3)

With Alternative DEL-3, the large trees that line the south side of Southwest Genesee Street and screen views into the West Seattle Golf Course would be removed (Figure 3-5f). The presence of the single row of guideway columns and overhead guideway heading to the tunnel portal would introduce large-scale elements into this view, which would lower the high average vividness to low average. The high average unity of the view would be reduced to low. The elevated guideway would not block views to the top of Southwest Genesee Street, and the high average intactness of the view would be reduced to low. The existing high average visual quality of the view would be reduced to low; this would be a visual impact.

Figure 3-5f. KOP WS-15: Alternative DEL-3

3.5.2.6 Delridge Way Station Lower Height Alternative (DEL-4)

The influence of Alternative DEL-4 on the visual quality of the view from this location would be very similar to that of Alternative DEL-2a. The removal of trees along the south side of Southwest Genesee Street would reduce the existing high average vividness of the view to average. The presence of the golf course netting and support poles would be noticeable but would not reduce the visual quality. The change in the view would reduce the existing high average intactness of the view to low. The single row of guideway columns and elevated guideway heading to the tunnel portal would establish a somewhat coherent pattern in the view and would not block views toward the western end of Southwest Genesee Street (Figure 3-5g). The removal of trees south of Southwest Genesee Street, unity would be reduced from high average to low average. The visual quality of the view from this location would be reduced from high average to low average, which would not be a visual impact.

Figure 3-5g. KOP WS-15: Alternative DEL-4

3.6 KOP WS-16: Longfellow Creek Legacy Trailhead on Southwest Yancy Street, Looking North

3.6.1 Existing Condition

KOP WS-16 represents the view looking north from the Longfellow Creek Legacy Trailhead along Southwest Yancy Street. This view was captured to show how changes to this area might affect trail users. The tree canopy over the existing creek alignment is dense and frames the view to the parking lot and commercial building in the foreground (Figure 3-6a). The overall vividness and intactness is average due to the lack of distinctiveness of the parking lot, while maintaining a forested character. The unity of the view is high average, with the tree canopy confined primarily to the riparian area that encompasses the creek and views to the commercial and industrial buildings in the background. Views outside of the trail are average because the adjacent roadways, vehicles, parking lot, and commercial buildings are consistent with the neighborhood character. The overall visual quality of the view is average.

Figure 3-6a. KOP WS-16: Existing Condition

3.6.2 Summary of Visual Quality Changes, by Alternative

Table 3-6 compares the ratings for visual quality components in the existing condition at KOP WS-16 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-6. KOP WS-16 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	Andover Street Station Alternative (DEL-5)	Andover Street Station Lower Height Alternative (DEL-6a)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)
Vividness	Average	High Average	Average	Average	High Average
Intactness	Average	Low	Low Average	Low Average	Low
Unity	High Average	Low Average	Low Average	Low Average	Low Average
Visual Quality	**Average**	**Low Average**	**Low Average**	**Low Average**	**Low Average**

Note: Alternative DEL-5 would be the same as Alternative DEL-6a, and Alternative DEL-7 would be the same as Preferred Option DEL-6b; therefore, these alternatives were not simulated. Alternative DEL-1a, Alternative DEL-1b, Alternative DEL-2a, Alternative DEL-2b, Alternative DEL-3 and Alternative DEL-4 would not be seen and therefore were not included in this table or simulated.

3.6.2.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

With Preferred Option DEL-6b, the guideway alignment would be much closer to the viewer than with Alternative DEL-5, Alternative DEL-6a, and Alternative DEL-7. The guideway columns and structure would become more dominant and memorable in the foreground to sensitive viewers. However, the existing trees and other vegetation partially screen the structure (Figure 3-6b). This would result in a slight increase in the vividness, from average to high average. The scale of the structure would be disharmonious with the natural setting of the trail and trailhead and would lower the intactness and unity from average to low average. The visual quality would lower from average to low average, which would not be a visual impact.

Figure 3-6b. KOP WS-16: Preferred Option DEL-6b

3.6.2.2 Andover Street Station Alternative (DEL-5)

With Alternative DEL-5, the view of the guideway would mostly be obscured by existing vegetation (Figure 3-6c). Due to the height of the guideway from KOP WS-16, the viewer would primarily be visually drawn to the street and parking in the foreground, which would not alter the vividness from average. The intactness would be slightly lowered to low average due to the guideway's disharmonious context with the natural setting of the trail and the human-built alignment. Unity would be slightly lowered from high average to low average due to the height and scale of the guideway in relationship to the trail and trailhead setting. The visual quality would be slightly lowered from average visual quality to low average visual quality, which would not be a visual impact.

3.6.2.3 Andover Street Station Lower Height Alternative (DEL-6a)

The influence of Alternative DEL-6a on the visual quality of this view would be similar to that of Alternative DEL-5a (Figure 3-6c). The visual quality of the view would decrease from average to low average, which would not be a visual impact.

Figure 3-6c. KOP WS-16: Alternative DEL-6a

3.6.2.4 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

The influence of Alternative DEL-7 on the visual quality of this view would be similar to that of Preferred Option DEL-6b (Figure 3-6b). The visual quality of the view would lower the visual quality from average to low average, which would not be a visual impact.

3.7 KOP WS-17: Longfellow Creek Natural Area on 28th Avenue Southwest, Looking North

3.7.1 Existing Condition

KOP WS-17 was selected to show how changes to the residential and park setting might impact park visitors and other sensitive viewers (Figure 3-7a). The character of this area is primarily residential, with views to the industrial building in the background. The impact of industrial and commercial development is most significant at the north end of the neighborhood and reduces the memorability of the view to average. The urban canopy over the existing creek alignment is dense and maintains the intactness of the overall view. However, the unity of the view is low average with the tree canopy confined primarily to the riparian zone. The overall quality of this view is average because the residential and park space is the dominant character, and the industrial development views do not overpower the view.

Figure 3-7a. KOP WS-17: Existing Condition

3.7.2 Summary of Visual Quality Changes, by Alternative

Table 3-7 compares the ratings for visual quality components in the existing condition at KOP WS-17 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-7. KOP WS-17 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	Andover Street Station Alternative (DEL-5)	Andover Street Station Lower Height Alternative (DEL-6a)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)
Vividness	Average	High Average	High Average	High Average	High Average
Intactness	Average	Low Average	Low Average	Low Average	Low Average
Unity	Low Average	Low Average	Low Average	Low Average	Low Average
Visual Quality	**Average**	**Low Average**	**Low Average**	**Low Average**	**Low Average**

Note: Alternative DEL-5 would be the same as Alternative DEL-6a, and Alternative DEL-7 would be the same as Preferred Option DEL-6b from this view; therefore, these alternatives were not simulated. Alternative DEL-1a, Alternative DEL-1b, Alternative DEL-2a, Alternative DEL-2b, Alternative DEL-3 and Alternative DEL-4 would not be seen and therefore were not included in this table or simulated.

3.7.2.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

The guideway alignment for Preferred Option DEL-6b would be in front of the industrial development (Figure 3-7b). Trains would become more apparent to viewers at the park and increase the memorability slightly. The vividness would slightly increase from average to high average. The height and scale of the guideway and columns would be a factor and more noticeable compared to the residential character and the industrial building in the background, and would slightly alter the intactness of the view from average to low average. The unity would not be altered from low average because this option would be on the edge of the non-residential and park development and portions of the structure would be screened by existing vegetation. The visual quality would slightly decrease from average to low average in this setting, which would not be a visual impact.

Figure 3-7b. KOP WS-17: Preferred Option DEL-6b

3.7.2.2 Andover Street Station Alternative (DEL-5)

The guideway alignment under Alternative DEL-5 would be in front of the industrial development (Figure 3-7c). Trains would become more apparent to viewers at Longfellow Creek Natural Area and increase the memorability slightly. Vividness would slightly increase from average to high average. The height and scale of the guideway would be more noticeable compared to the residential character and the industrial building in the background and would slightly alter the intactness of the view from average to low average. The unity would not be altered from low average, as the alignment would be on the edge of the non-residential and park development. The visual quality would slightly decrease from average to low average in this setting, which would not be a visual impact.

3.7.2.3 Andover Street Station Lower Height Alternative (DEL-6a)

The influence of Alternative DEL-6a on the visual quality of this view would be similar to that of Alternative DEL-5 (Figure 3-7c) discussed below. The visual quality of the view would decrease from average to low average, which would not be a visual impact.

Figure 3-7c. KOP WS-17: Alternative DEL-6a

3.7.2.4 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

The influence of Alternative DEL-7 on the visual quality of this view would be similar to that of Preferred Option DEL-6b (Figure 3-7b). The visual quality of the view would decrease from average to low average which would not be a visual impact.

3.8 KOP WS-18: Southwest Avalon Way, Looking South

3.8.1 Existing Condition

The KOP WS-18 location was selected to represent the view of the adjacent residences while heading south on Southwest Avalon Way (Figure 3-8a). The view includes mixed density residential and commercial buildings. The vividness of the view is low average because the wide roadway and street trees dominate the view. Intactness is low average because the land uses are mostly residential; however, a large storage facility is on the east side of the street and overhead power lines and poles also dominate the view. Unity is low average because the neighborhood appears in transition, with older light industrial buildings, predominance of power lines, street trees and newer residential buildings in the view. Visual quality is low average.

Figure 3-8a. KOP WS-18: Existing Condition

3.8.2 Summary of Visual Quality Changes, by Alternative

Table 3-8 compares the ratings for visual quality components in the existing condition at KOP WS-18 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-8. KOP WS-18 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	Andover Street Station Lower Height Alternative (DEL-6a)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)
Vividness	Low Average	Average	Average	Average
Intactness	Low Average	Low Average	Low Average	Low Average
Unity	Low Average	Low Average	Low Average	Low Average
Visual Quality	**Low Average**	**Low Average**	**Low Average**	**Low Average**

Note: Alternative DEL-5 would not be seen from this view and therefor, was not simulated or included in this table. Alternative DEL-1a, Alternative DEL-1b, Alternative DEL-2a, Alternative DEL-2b, Alternative DEL-3, and Alternative DEL-4 would not be seen and therefore were not included in this table or simulated

3.8.2.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

From KOP WS-18, the view with Preferred Option DEL-6b looking south would be framed by the guideway and columns, which would slightly increase the memorability of this view and slightly increase the vividness from low average to average (Figure 3-8b). Intactness would remain average based on the slightly lowered height of the guideway, which would be at a similar scale with the multi-family residential buildings. The power lines would remain within the view and provide visual clutter but not enough to alter the intactness. With the guideway structure framing, looking south, the unity would remain low average, with the visual focus primarily on the road ahead and the residential buildings in the background and lack of compositional harmony. The visual quality would remain as low average, which would not be a visual impact.

Figure 3-8b. KOP WS-18: Preferred Option DEL-6b

3.8.2.2 Andover Street Station Lower Height Alternative (DEL-6a)

The view looking south along Southwest Avalon Way with Alternative DEL-6a would be framed by the guideway and columns, which would slightly increase the memorability of this view and slightly increase the vividness from low average to average (Figure 3-8c). Intactness would remain low average due to the height of the guideway being at a similar scale as the multi-family residential buildings. The power lines would remain within the view and provide visual clutter but not enough to alter the intactness. With the framing of the structure looking south, the unity would slightly increase from low average to average, with the visual focus primarily on the road ahead and the residential buildings in the background. The visual quality would remain as low average, which would not be a visual impact.

Figure 3-8c. KOP WS-18: Alternative DEL-6a

3.8.2.3 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

Similar to Preferred Option DEL-6b, Alternative DEL-7 guideways and guideway columns would frame the existing view looking south and would slightly increase the memorability from low average to average (Figure 3-8d). Intactness would remain low average due to the power lines and poles remaining in the view that provide visual clutter. The unity would remain low average due to the lack of compositional harmony between the structures, buildings, and the visual clutter of the overhead power lines and poles. Visual quality would remain low average, which would not be a visual impact.

Figure 3-8d. KOP WS-18: Alternative DEL-7

3.9 KOP WS-19: Southwest Yancy Street, Looking East from Intersection at 30th Avenue Southwest

3.9.1 Existing Condition

KOP WS-19 represents the view that residents along this portion of Southwest Yancy Street would see when looking east. The character of this neighborhood is both commercial and residential and common for the larger West Seattle area (Figure 3-9a). Street trees and landscape screening preserve some of the residential character of the street. Utility poles and overhead wires are also strong visual elements in the view. The street has low average unity and intactness because of the commercial development to the north and east. The downhill midpoint of the view includes Longfellow Creek Natural Area to the north and south. The overall quality of the view is low average due to lower unity and intactness.

Figure 3-9a. KOP WS-19: Existing Condition

3.9.2 Summary of Visual Quality Changes, by Alternative

Table 3-9 compares the ratings for visual quality components in the existing condition at KOP WS-19 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-9. KOP WS-19 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	Andover Street Station Lower Height Alternative (DEL-6a)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)
Vividness	Average	High Average	High Average	High Average
Intactness	Low Average	Low Average	Low Average	Low Average
Unity	Low Average	Low Average	Low Average	Low Average
Visual Quality	**Low Average**	**Average**	**Average**	**Average**

Note: Alternative DEL-5 would not be seen from this view and therefore was not simulated or included in this table. Alternative DEL-1a, Alternative DEL-1b, Alternative DEL-2a, Alternative DEL-2b, Alternative DEL-3, and Alternative DEL-4 would not be seen and therefore were not simulated or included in this table.

3.9.2.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

Preferred Option DEL-6b would be on the south side of Southwest Yancy Street and close to the residential buildings on the south side of the street in the foreground (Figure 3-9b). Due to the height of the structure, the openness of the area, and views to the north where the light industrial building would be removed for this alternative, the vividness or memorability of the view would slightly increase from average to high average. The intactness and unity would slightly decrease to a low average based on the prominence of the guideway's proximity encroachment to the residences, the introduction of a traction power sub-station, and the contextual environment of the existing industrial building character on the north side of Southwest Yancy Street. With Preferred Option EL-6b, the power lines would remain, but some of the existing vegetation would be removed and expose more of the larger industrial buildings to the residential viewers on the south side of Southwest Yancy Street. The visual quality would slightly increase from low average to average, which would not be a visual impact.

Figure 3-9b. KOP WS-19: Preferred Option DEL-6b

3.9.2.2 Andover Street Station Lower Height Alternative (DEL-6a)

Alternative DEL-6a would be on the north side of the light industrial building in the foreground view from KOP WS-19, and due to the height of the guideway structure, the vividness or memorability of the view would slightly increase from average to high average (Figure 3-9c). The intactness and unity would slightly decrease to a low average based on the contextual environment of the existing industrial and light commercial building character on this north side of Southwest Yancy Street. With Alternative DEL-6a, the existing light industrial buildings and power lines would remain, but some of the existing vegetation would be removed and expose more of the buildings to the residential viewers on the south side of Southwest Yancy Street. The visual quality would slightly increase from low average to average, which would not be a visual impact.

Figure 3-9c. KOP WS-19: Alternative DEL-6a

3.9.2.3 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

Similar to Preferred Option DEL-6b, Alternative DEL-7 would be on the south side of the light industrial building and closer to the residential buildings on the south side of Southwest Yancy Street (Figure 3-9d). Due to the height of the structure, the openness of the area, and views to the north where the light industrial building would be removed in this alternative the vividness or memorability of the view would slightly increase from average to high average. The intactness and unity would slightly decrease to a low average due to the prominence of the guideway and encroachment on the residences as well as the contextual environment of the existing industrial building character on the north side of Southwest Yancy Street. With Alternative DEL-7, the traction power sub-station would not be visible from KOP WS-19 and the power lines would remain. However, some of the existing vegetation would be removed and expose more of the larger industrial buildings to the residential viewers on the south side of Southwest Yancy Street. The visual quality would slightly increase from low average to average, which would not be a visual impact.

Figure 3-9d. KOP WS-19: Alternative DEL-7

3.10 KOP WS-20: Looking Past the North End of the West Seattle Golf Course

3.10.1 Existing Condition

The view from KOP WS-20, in the north part of the West Seattle Golf Course, includes features of the golf course and views of the Downtown Seattle skyline (Figure 3-10a). The foreground includes fairways, greens, a sand trap, paths, and trees. Trees along the north side of the golf course and north of Southwest Genesee Street screen views of the nearby neighborhood on the north side of Southwest Genesee Street. Shorter vegetation allows views of Downtown Seattle as well as Port of Seattle gantry cranes at Terminal 18. The character of the view is clearly pastoral, with an urban background. The vividness of this view is high (due primarily to the unique combination of a golf course with a framed view of the downtown skyline and Port of Seattle cranes). The view has high ratings for intactness and unity. The visual quality of the view is high.

Figure 3-10a. KOP WS-20: Existing Condition

3.10.2 Summary of Visual Quality Changes, by Alternative

Table 3-10 compares the ratings for visual quality components in the existing condition at KOP WS-20 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-10. KOP WS-20 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Dakota Street Station Alternative (DEL-1a)	Dakota Street Station North Alignment Option (DEL-1b)	Dakota Street Station Lower Height Alternative (DEL-2a)	Dakota Street Station Lower Height North Alignment Option (DEL-2b)	Delridge Way Station Alternative (DEL-3)	Delridge Way Station Lower Height Alternative (DEL-4)
Vividness	High	High	High	Average	Average	High	Average
Intactness	High	Low	Low	Low	Average	Low	Low Average
Unity	High	Low Average	Low Average	Low Average	Low Average	Low Average	Low Average
Visual Quality	**High**	**Low Average**	**Low Average**	**Low Average**	**Average**	**Low Average**	**Low Average**

Note:
Preferred Option DEL-6b, Alternative DEL-5, Alternative DEL-6a, and Alternative DEL-7 would not be seen from this view and therefore were not simulated or included in this table.

3.10.2.1 Dakota Street Station Alternative (DEL-1a)

The elevated guideway with Alternative DEL-1a would pass over the view toward Downtown Seattle and, along with the two support structures and passing trains, would be a unique major visual element in the view (Figure 3-10b). Trees along Southwest Genesee Street would be removed and no longer screen the view of residences on the north side of the street. The tree removals would somewhat open distant views of Downtown Seattle. The vividness or memorability of the view with the elevated guideway and support structures would continue to be high. The location, scale, form, color, and materials of this alternative's elevated guideway and support structures would encroach on the viewed landscape; be silhouetted against the sky; and introduce a new, major transportation facility element into a view that is currently park-like in character. The intactness of the view would be reduced to low. The removal of screening vegetation along Southwest Genesee Street would open views of residences north of the street, which along with the elevated guideway and columns, would add new elements into the view and reduce the high degree of visual unity to low average. The visual quality of the view would be reduced from high to low average, which would be a visual impact.

Figure 3-10b. KOP WS-20: Alternative DEL-1a

3.10.2.2 Dakota Street Station North Alignment Option (DEL-1b)

The influence of Option DEL-1b on the visual quality of this view, as shown in Figure 3-10c, would be very similar to that of Alternative DEL-1a. The visual quality of the view would be reduced from high to low average, which would be a visual impact.

Figure 3-10c. KOP WS-20: Option DEL-1b

3.10.2.3 Dakota Street Station Lower Height Alternative (DEL-2a)

The elevated guideway with Alternative DEL-2a would be visible as it would begin its transition into the tunnel west of this location (Figure 3-10d). The alignment would require the removal of trees along the south side of Southwest Genesee Street because it would extend into the West Seattle Golf Course. The tree removals would open views to the south toward the alignment from residences on the north side of Southwest Genesee Street as well as open up more views of Downtown Seattle to the north for golfers. The presence of the golf course netting and support poles would be noticeable but would not reduce the visual quality. From this location, the elevated guideway would have an appearance like that of an elevated overpass (unless trains were traveling on it). The high vividness of the view would be reduced to average.

The strong presence (horizontal form, color, materials, and scale) of the elevated guideway, trains, sound wall, and portal retaining wall would encroach on the viewed landscape of the golf course and introduce a major transportation facility element into the view. The elevated guideway encroachment into the view of Downtown Seattle, the portal retaining wall, and construction within the golf course that would permanently change the appearance of its north end would reduce visual intactness to low. The high unity of the existing view would be reduced to low average by this alternative's changes to the existing visual pattern (but would allow some visual connection with the downtown skyline). The visual quality rating of the view would be reduced from high to low average, which would be a visual impact.

Figure 3-10d. KOP WS-20: Alternative DEL-2a

3.10.2.4 Dakota Street Station Lower Height North Alignment Option (DEL-2b)

The portion of Option DEL-2b that would be seen from KOP WS-20 would be north of Southwest Genesee Street (Figure 3-10e). The alignment would require the removal of trees and residences north of Southwest Genesee Street, little of which would be noticed from this location. Part of the elevated guideway and trains would be visible and would somewhat intrude into views of the downtown skyline and reduce the high vividness of the view to average. The presence of the golf course netting and support poles would be noticeable but would not reduce the visual quality. The elevated guideway would be somewhat of an encroachment into the view of Downtown Seattle, passing trains would be seen, and the intactness of the view would be reduced from high to average. The high unity of the view would be slightly reduced to low average with the addition of the elevated guideway into the view. The visual quality of the view would be reduced from high to average, which would be a visual impact.

Figure 3-10e. KOP WS-20: Option DEL-2b

3.10.2.5 Delridge Way Station Alternative (DEL-3)

The influence of Alternative DEL-3 on the visual quality of this view would be similar to that of Alternative DEL-1a (Figure 3-10b). The visual quality of the view would be reduced from high to low average, which would be a visual impact.

3.10.2.6 Delridge Way Station Lower Height Alternative (DEL-4)

The influence of Alternative DEL-4 on the visual quality of this view would be similar to that of Alternative DEL-2a (Figure 3-10d). The visual quality of the view would be reduced from high to low average, which would be a visual impact.

3.11 KOP WS-21: Looking East along Southwest Genesee Street from Southwest Avalon Way

3.11.1 Existing Condition

The view from KOP WS-21 represents what residents in this area see when looking east along Southwest Genesee Street. The view includes the downhill and uphill gradients of Southwest Genesee Street and the Pigeon Point area beyond (Figure 3-11a). Single-family residences along the north (left) side of Southwest Genesee Street give the area a residential character. Tall trees along the south (right) side of the view block views into the north end of the West Seattle Golf Course. The sloping terrain, trees, structures, and utility lines and poles are strong visual elements in this view. The viewed landscape is somewhat memorable and has a slightly high average degree of vividness. The visual intactness rating of the viewed area is high average. Utility lines intrude on the view and somewhat decrease the unity rating of the view to average. The view's visual quality rating is high average.

Figure 3-11a. KOP WS-21: Existing Condition

3.11.2 Summary of Visual Quality Changes, by Alternative

Table 3-11 compares the ratings for visual quality components in the existing condition at KOP WS-21 with the ratings for each alternative. The visual changes related to these alternatives are described in the following section.

3.11.2.1 Dakota Street Station Alternative (DEL-1a)

The column to the right in this view with Alternative DEL-1a would block views down the south (right) side of Southwest Genesee Street and beyond up the hill to Pigeon Point (Figure 3-11b). It would also block views of the tree removals along the south side of the street and this alternative route though the West Seattle Golf Course. Residences and some of the trees along the north side of the street would remain. The existing overhead utilities on the north side of Southwest Genesee Street would shift farther to the north but would not alter the visual quality. The curving elevated guideway near the east end of Southwest Genesee Street, would create a memorable visual element due to its size and form. Overall, however, the above average vividness of the view would be reduced to average. The view on the north side of the street would remain intact, although the view on the south side and beyond would effectively change reducing the intactness of the view to low average. The unity rating would be lowered from average to low average. The visual quality of the view would be lowered from high average to low average, which would not be a visual impact.

Figure 3-11b. KOP WS-21: Alternative DEL-1a

Table 3-11. KOP WS-21 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Dakota Street Station Alternative (DEL-1a)	Dakota Street Station North Alignment Option (DEL-1b)	Dakota Street Station Lower Height Alternative (DEL-2a)	Dakota Street Station Lower Height North Alignment Option (DEL-2b)	Delridge Way Station Alternative (DEL-3)	Delridge Way Station Lower Height Alternative (DEL-4)
Vividness	High Average	Average	High Average	High Average	High Average	Average	High Average
Intactness	High Average	Low Average	Low	Low Average	Low Average	Low Average	Average
Unity	Average	Low Average	Low Average	Average	Average	Low Average	Average
Visual Quality	**High Average**	**Low Average**	**Low Average**	**Average**	**Average**	**Low Average**	**Low Average**

Note:

Preferred Option DEL-6b, Alternative DEL-5, Alternative DEL-6a, and Alternative DEL-7 would not be seen from this view and therefore were not simulated or included in this table.

3.11.2.2 Dakota Street Station North Alignment Option (DEL-1b)

Option DEL-1b would remove all the residences and vegetation on the north side of the view (left), which would open views to the east and north that are currently obscured by trees and buildings (Figure 3-11c). Because the elevated guideway would be seen as a sweeping element curving from left to right though this view, the memorability or vividness of the view would remain high average. The closeness of the large-scale guideway columns and elevated guideway would encroach on this view of a residential area and reduce the intactness from high average to low. Because so much of the elevated guideway could be seen in the landscape, thus providing a somewhat unifying element, and because the appearance of most of the area on the north side of Southwest Genesee Street would be maintained, the view would be different than it is now but nevertheless coherent. The existing overhead utilities on the north side of Southwest Genesee Street would shift farther to the north but would not alter the visual quality. This would result in the unity rating of the view decreasing from above average to low average. The visual quality of the view would be reduced from high average to low average, which would not be a visual impact.

Figure 3-11c. KOP WS-21: Option DEL-1b

3.11.2.3 Dakota Street Station Lower Height Alternative (DEL-2a)

Alternative DEL-2a would be located entirely on the south (right) side of Southwest Genesee Street along the northern part of the West Seattle Golf Course at an elevation lower than the viewer (Figure 3-11d). Potential sound walls along the eastern portion of Southwest Genesee Street would be on the elevated guideway and would not be very different in appearance than the guideway structure. Freestanding sound walls would be on the western part of Genesee right before the alignment enters into a tunnel. In this area, the sound walls would be noticeable and more memorable than the existing view. The change would not be enough to change the vividness rating. The sound wall near the tunnel portal would contrast with the existing view in terms of height, bulk, and scale, and would be an encroachment into the view. The above average intactness of the view would be reduced to low average. The average unity rating of the view would be maintained because the viewed landscape would continue to have a somewhat coherent visual pattern. The visual quality of the view would be lowered from high average to average, which would not be a visual impact.

Figure 3-11d. KOP WS-21: Alternative DEL-2a

3.11.2.4 Dakota Street Station Lower Height North Alignment Option (DEL-2b)

Option DEL-2b would be located entirely on the north (left) side of Southwest Genesee Street at an elevation lower than the viewer. This option would open views to the east and north that are currently obscured by trees and buildings (Figure 3-11e). Potential sound walls along the eastern portion of Southwest Genesee Street would be on the elevated guideway and would not be very different in appearance than the guideway structure. Freestanding sound walls would be on the western part of Genesee right before the alignment enters into a tunnel. In this area, the sound walls would be noticeable and more memorable than the existing view, but vegetation would act as a visual buffer. The change would not be enough to change the vividness rating. The sound wall near the tunnel portal would contrast with the existing view in terms of height, bulk, and scale, and would be an encroachment into the view. The above average intactness of the view would be reduced to low average. The average unity rating of the view would be maintained because the viewed landscape would continue to have a somewhat coherent visual pattern. The visual quality of the view would be lowered from high average to average, which would not be a visual impact.

Figure 3-11e. KOP WS-21: Option DEL-2b

3.11.2.5 Delridge Way Station Alternative (DEL-3)

From KOP WS-21, the influence of Alternative DEL-3 on visual quality would be similar to that of Alternative DEL-1a, although the curve of the Alternative DEL-1a elevated guideway would not be seen in the distance (Figure 3-11f). The visual quality of the view would be lowered from high average to low average, which would not be a visual impact.

Figure 3-11f. KOP WS-21: Alternative DEL-3

3.11.2.6 Delridge Way Station Lower Height Alternative (DEL-4)

The influence of Alternative DEL-4 on the visual quality of this view would be similar to that of Alternative DEL-2a (Figure 3-11g). The visual quality of the view would be lowered from high average to low average, which would not be a visual impact.

Figure 3-11g. KOP WS-21: Alternative DEL-4

3.12 KOP WS-22: Intersection of Southwest Andover Street and 32nd Avenue Southwest, Looking South

3.12.1 Existing Condition

KOP WS-22 was selected to examine changes that residents and other sensitive viewers would experience looking south on 32nd Avenue Southwest. The neighborhood is typical for West Seattle, so vividness is rated as average (Figure 3-12a). The character of the area is primarily single-family residential, with a high average degree of intactness and unity. Overall, the aesthetic quality is rated as high average.

Figure 3-12a. KOP WS-22: Existing Condition

3.12.2 Summary of Visual Quality Changes, by Alternative

Table 3-12 compares the ratings for visual quality components in the existing condition at KOP WS-22 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-12. KOP WS-22 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	Andover Street Station Lower Height Alternative (DEL-6a)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)
Vividness	Average	Low	Average	Low
Intactness	High Average	Low	Average	Low
Unity	High Average	Low	Average	Low
Visual Quality	**High Average**	**Low**	**Average**	**Low**

Note: Alternative DEL-5 would not be seen from this view and therefore was not simulated or included in this table. In addition, Alternative DEL-1a, Alternative DEL-1b, Alternative DEL-2a, Alternative DEL-2b, Alternative DEL-3, and Alternative DEL-4 would not be seen from this view and therefore were not simulated or included in this table.

3.12.2.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

In the view from KOP WS-22, Preferred Option DEL-6b is in a retained cut (Figure 3-12b). This view represents what the remaining residences would see looking south from Southwest Yancy Street. The vividness of this view would be lowered from average to low due to the encroachment of the guideway structure, retaining walls, fencing, and sound walls on the views to the south, and the visual focus would be toward the tree, utility poles, and power lines in the background. The intactness and unity would be lowered from high average to low due to the structure, retaining walls, and the street end. In addition, removal of landscaping and residences would create a discontinuous sense and lack of harmony of the residential neighborhood. The overall visual quality would be lowered from high average to low, which would be a visual impact.

Figure 3-12b. KOP WS-22: Preferred Option DEL-6b

3.12.2.2 Andover Street Station Lower Height Alternative (DEL-6a)

With Alternative DEL-6a, the visible portion of the guideway would be minimal from neighbors at Southwest Yancy Street (Figure 3-12c). The vividness or degree of drama that the structure and openness on the west side of 32nd Avenue Southwest provide in this view would maintain the average neighborhood character. The intactness would be slightly reduced to average, and due to the removal of residences, this alternative would not alter the view to the south enough to have an impact on visual quality. The removal of residential buildings on the west side of 32nd Avenue Southwest and the presence of the guideway would lower the sense of unity from high average to average. The overall visual quality would change slightly and be reduced to average, which is not considered a visual impact.

Figure 3-12c. KOP WS-22: Alternative DEL-6a

3.12.2.3 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

Similar to Preferred Option DEL-6b, Alternative DEL-7 would be in a retained cut in the view from KOP WS-22 (Figure 3-12d). The vividness of this view would be lowered from average to low due to the encroachment of the guideway structure and retaining walls on the views to the south, and the visual focus would be toward the utility poles and power lines in the foreground. The intactness and unity would be lowered from high average to low due to the structure, retaining walls, and street and landscape removal. The residential buildings provide a lack of harmony to the existing residential neighborhood visual character. The overall visual quality with this alternative would be lowered from high average to low, which would be a visual impact.

Figure 3-12d. KOP WS-22: Alternative DEL-7

3.13 KOP WS-23: Southwest Avalon Way, Looking Northeast

3.13.1 Existing Condition

KOP WS-23 was selected to represent the view that residential sensitive viewers would see looking northeast on Southwest Avalon Way. The view includes mixed-use residential and commercial land uses and appears as a neighborhood with ongoing redevelopment (Figure 3-13a). Partial views of Elliott Bay, portions of the Terminal 5 facility, and Downtown Seattle in the distance contribute to the memorability and vividness of this viewpoint. Utility poles and the wide roadway are strong visual elements in this view, and there are few mature trees, which rates this view as average intactness. Unity, however, is rated high average due to the strong architectural presence of the facades. The overall visual quality of the view is high average due to the scenic nature of Elliott Bay and downtown skyline view.

Figure 3-13a. KOP WS-23: Existing Condition

3.13.2 Summary of Visual Quality Changes, by Alternative

Table 3-13 compares the ratings for visual quality components in the existing condition at KOP WS-23 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-13. KOP WS-23 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	Andover Street Station Lower Height Alternative (DEL-6a)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)
Vividness	High	High Average	High Average	High Average
Intactness	Average	Low Average	Low Average	Low Average
Unity	High Average	Low Average	Low Average	Low Average
Visual Quality	**High Average**	**Average**	**Average**	**Average**

Note: Alternative DEL-5 would not be seen from this view and therefore was not simulated or included in this table. In addition, Alternative DEL-1a, Alternative DEL-1b, Alternative DEL-2a, Alternative DEL-2b, Alternative DEL-3 and Alternative DEL-4 would not be seen from this view and therefore were not simulated or included in this table.

3.13.2.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

Preferred Option DEL-6b would pass from northeast to southwest across Southwest Avalon Way near its intersection with Southwest Yancy Street (Figure 3-13b). The elevated structure and guideway columns would be similar in scale with the elements and multi-family buildings currently near this intersection. The elevated guideway would encroach on and somewhat intrude upon views of Downtown Seattle. The above high vividness of the view would be reduced to high average. The elevated structure and guideway columns would be encroachments into the view to downtown at this location and would reduce the intactness rating from average to low average. The placement of guideway columns would frame views to the industrial buildings and a portion of the Terminal 5 facility; this would also reduce the unity of the existing unobstructed view. The high average visual quality rating would be reduced slightly to average but not enough to be a visual impact.

Figure 3-13b. KOP WS-23: Preferred Option DEL-6b

3.13.2.2 Andover Street Station Lower Height Alternative (DEL-6a)

Alternative DEL-6a would pass from northeast to southwest across Southwest Avalon Way near its intersection of Southwest Yancy Street (Figure 3-13c). From the perspective of KOP WS-23, the elevated structure and guideway columns would be similar in scale with the elements and multi-family buildings currently near this intersection. The elevated guideway would encroach on and somewhat intrude upon views of Downtown Seattle. The high vividness of the current view would be reduced to high average. The elevated structure and columns would encroach on the view to downtown and would reduce the intactness rating from average to low average. The placement of guideway columns would frame views to the industrial buildings and a portion of the Terminal 5 facility; this would also reduce the unity of the existing unobstructed view. The high average visual quality rating would be reduced somewhat to average but not enough to be a visual impact.

Figure 3-13c. KOP WS-23: Alternative DEL-6a

3.13.2.3 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

The influence of Alternative DEL-7 on KOP WS-23 would be the same to that under Preferred Option DEL-6b (Figure 3-13d). Visual quality would be reduced slightly from high average to average but not enough to be a visual impact.

Figure 3-13d. KOP WS-23: Alternative DEL-7

3.14 KOP WS-24: Southwest Avalon Way, Looking North at Intersection with Southwest Genesee Street

3.14.1 Existing Condition

KOP WS-24 was selected to represent views that residents in this area have when looking along Southwest Avalon Way as it descends to the north. The view includes multi-story, multi-family buildings on either side of Southwest Avalon Way, Harbor Island, Elliott Bay, and the Downtown Seattle skyline (Figure 3-14a). The character of the view is urban, and its vividness (with the optimal type of light available when the photograph was taken) is high average. Utility lines, traffic signals, and their associated poles are very apparent in the foreground of this view and, along with storage containers and other facilities at Harbor Island, detract from the intactness of the view, resulting in a slightly low average intactness rating. The unity of the view is average, as is visual quality.

Figure 3-14a. KOP WS-24: Existing Condition

3.14.2 Summary of Visual Quality Changes, by Alternative

Table 3-14 compares the ratings for visual quality components in the existing condition at KOP WS-24 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 3-14. KOP WS-24 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Dakota Street Station Alternative (DEL-1a)	Dakota Street Station North Alignment Option (DEL-1b)	Delridge Way Station Alternative (DEL-3)	Andover Street Station Alternative (DEL-5)
Vividness	High Average	High Average	High Average	High Average	Low Average
Intactness	Low Average	Low Average	Low Average	Low Average	Low
Unity	Average	Low Average	Low Average	Low Average	Low
Visual Quality	**Average**	**Low Average**	**Low Average**	**Low Average**	**Low**

Note:

Preferred Option DEL-6b, Alternative DEL-6a, and Alternative DEL-7 would not be seen from this view and therefore were not simulated or included in the table. In addition, Alternative DEL-2a, Alternative DEL-2b, and Alternative DEL-4 would not be seen from this view and therefore were not simulated or included in this table.

3.14.2.1 Dakota Street Station Alternative (DEL-1a)

Alternative DEL-1a would pass over Southwest Avalon Way near its intersection with Southwest Genesee Street and remove a multi-story, multi-family building on the northwest corner of the intersection (Figure 3-14b). The mass of the elevated structure and guideway columns would be greater than the scale of the intersection. The structures and guideway columns form, materials, and texture would be architecturally inconsistent. Because the view of Downtown Seattle would not be blocked, the vividness of the view would remain high average. The elevated guideway and columns would be encroachments into the view but based on the height of the elevated guideway (and views of Downtown Seattle beneath the guideway) would not further reduce the low average intactness. This alternative would not be consistent with the existing visual pattern of the streetscape and adjacent areas, so the average unity rating would be reduced to low average. Visual quality would be reduced from average to low average, which would not be a visual impact.

Figure 3-14b. KOP WS-24: Alternative DEL-1a

3.14.2.2 Dakota Street Station North Alignment Option (DEL-1b)

The influence of Option DEL-1b on the visual quality of this view would be very similar to that of Alternative DEL-1a (Figure 3-14c). Visual quality would be reduced from average to low average, which would not be a visual impact.

Figure 3-14c. KOP WS-24: Option DEL-1b

3.14.2.3 Delridge Way Station Alternative (DEL-3)

As shown in Figure 3-14d, the influence of Alternative DEL-3 on the visual quality of this view would be very similar to that of Alternative DEL-1a. Visual quality would be reduced from average to low average, which would not be a visual impact.

Figure 3-14d. KOP WS-24: Alternative DEL-3

3.14.2.4 Andover Street Station Alternative (DEL-5)

Alternative DEL-5 would pass from northeast to southwest above the intersection of Southwest Genesee Street and Southwest Avalon Way (Figure 3-14e). It would require the removal of multi-story, multi-family buildings on the west side of Southwest Avalon Way, and this would partially alter the residential character of Southwest Avalon Way. The elevated structure and guideway columns would be out of scale with the setting, and the alternative's weaving alignment would not follow the nearby street grid.

The elevated guideway would encroach on and partially eclipse views of Downtown Seattle. The above average vividness of the view would be reduced to low average. The elevated structure and guideway columns would be encroachments into the view of this location and would reduce the intactness rating from low average to low. The placement of a series of guideway columns and straddle bents in an area where buildings would be removed, along with the elevated guideway's weaving alignment, would not follow the visual pattern of the existing streetscape and decrease the unity rating from average to low. In addition, the number of introduced elements and shear mass of the structure would visually overpower what is architecturally a cohesive neighborhood. The average visual quality rating would be reduced from average to low, which would be a visual impact.

Figure 3-14e. KOP WS-24: Alternative DEL-5

3.15 KOP WS-25: 32nd Avenue Southwest, Looking Northeast

3.15.1 Existing Condition

The view from KOP WS-25 represents what residences in the area would see looking north along 32nd Avenue Southwest (Figure 3-15a). The view includes the downward slope of 32nd Avenue Southwest toward a distant partial view of Downtown Seattle, Port of Seattle facilities, and Elliott Bay through the trees in the foreground, with single-family residences and trees on both the east and west side of 32nd Avenue Southwest. The single-family residences on the west side of 32nd Avenue Southwest back up against the West Seattle Bridge (approach), with a buffer of trees between. The sloping terrain, trees, structures, and utility poles are strong visual elements in this view. The unity, vividness, and intactness are rated high average due to the consistent neighborhood character with partial views of the downtown skyline. The visual quality is high average.

Figure 3-15a. KOP WS-25: Existing Condition

3.15.2 Summary of Visual Quality Changes, by Alternative

Table 3-15 compares the ratings for visual quality components in the existing condition at KOP WS-25 with the ratings for. The visual changes related to are described in the following section.

Table 3-15. KOP WS-25 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	Andover Street Station Alternative (DEL-5)	Andover Street Station Lower Height Alternative (DEL-6a)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)
Vividness	High Average	Average	Average	Average	Average
Intactness	High Average	Low	Low	Low	Low
Unity	High Average	Low	Low	Low	Low
Visual Quality	High Average	**Low**	**Low**	**Low**	**Low**

Note:

Alternative DEL-5, Alternative DEL-6a, and Alternative DEL-7 would be similar from this view and therefore were not simulated. In addition, Alternative DEL-1a, Alternative DEL-1b, Alternative DEL-2a, Alternative DEL-2b, Alternative DEL-3, and Alternative DEL-4 would not be seen from this view and therefore were not simulated or included in this table.

3.15.2.1 Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

Preferred Option DEL-6b would cross in a retained cut (Figure 3-15b) near the north end of 32nd Avenue Southwest. It would remove a series of residences from both the east and the west side of the street. This view represents what the remaining residents would see looking north along 32nd Avenue Southwest. The vividness of this view would be lowered from high average to average due to the encroachment of the guideway structure, sound walls, and retaining walls but still maintain memorable partial views to the downtown skyline and the port facilities. The intactness and unity would be lowered from high average to low due to the guideway structure, retaining walls, and street end. The overhead power lines would be placed underground but would not alter the intactness or unity enough to increase the visual quality. In addition, removal of landscaping and residences would create a discontinuous sense and lack of harmony of the residential neighborhood. The overall visual quality would be lowered from high average to low, which would be a visual impact.

Figure 3-15b. KOP WS-25: Preferred Option DEL-6b

3.15.2.2 Andover Street Station Alternative (DEL-5)

The influence of Alternative DEL-5 on the visual quality of this view would be similar to that of Preferred Option DEL-6b (Figure 3-15b). The visual quality of the view would be reduced from high average to low, which would be a visual impact.

3.15.2.3 Andover Street Station Lower Height Alternative (DEL-6a)

The influence of Alternative DEL-6a (Figure 3-15c) on the visual quality of this view would be similar to that of Preferred Option DEL-6b. The vividness of this view would be lowered from high average to average due to the encroachment of the guideway structure, sound walls, and retaining walls but still maintain memorable partial views to the downtown skyline and the port facilities. The intactness and unity would be lowered from high average to low due to the encroachment of the guideway structure, retaining walls, and street end. The visual quality of the view would be reduced from high average to low, which would be a visual impact.

Figure 3-15c. KOP WS-25: Alternative DEL-6a

3.15.2.4 Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)

The influence of Alternative DEL-7 (Figure 3-15d) on the visual quality of this view would be similar to that of Preferred Option DEL-6b. The alignment would partially maintain views of the city skyline in the background, but would encroach upon the neighborhood visual character. The intactness and unity would be lowered from high average to low due to the guideway structure, sound walls, retaining walls, and street end. The visual quality of the view would be reduced from high average to low, which would be a visual impact.

Figure 3-15d. KOP WS-25: Alternative DEL-7

4 WEST SEATTLE JUNCTION SEGMENT

4.1 KOP WS-26: 35th Avenue Southwest, Looking South near Intersection with Fauntleroy Way Southwest

4.1.1 Existing Condition

KOP WS-26 was selected to represent the view looking southeast at potential visual impacts of the proposed Avalon Station area and across the intersection of Fauntleroy Way Southwest. The current view is predominantly transportation based; elements include high traffic roadways, sidewalks, and retail. (Figure 41a). New large-scale, multi-family residential structures and Providence Hospital are also visible along 35th Avenue Southwest. Vividness is rated as low average (but not low) because of the topography and trees visible at the top of the hill on 35th Avenue Southwest. The overall intactness and unity of this view are low because of the mix of different land uses and the visual clutter of utilities and signs. Overall, the visual quality of the KOP is rated low.

Figure 4-1a. KOP WS-26: Existing Condition

4.1.2 Summary of Visual Quality Changes, by Alternative

Table 4-1 compares the ratings for visual quality components in the existing condition at KOP WS-26 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 4-1. KOP WS-26 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)	Elevated 41st/42nd Avenue Station Alternative (WSJ-1)	Elevated Fauntleroy Way Station Alternative (WSJ-2)	Tunnel 41st Avenue Station Alternative (WSJ-3a)
Vividness	Low Average	Low Average	Low Average	Low Average	Low Average
Intactness	Low	Low Average	Low	Low	Low Average
Unity	Low	Low Average	Low	Low	Low Average
Visual Quality	**Low**	**Low Average**	**Low**	**Low**	**Low Average**

Note: Alternative WSJ-5a would be the same as Preferred Option WSJ-5b and therefore was not simulated or included in table. Alternative WSJ-4 would be the same as Alternative WSJ-1 and WSJ-2 and therefore was not simulated or included in the table. Alternative WSJ-3a, Alternative WSJ-3b, and Alternative WSJ-6 would be in a tunnel and would not be seen.

4.1.2.1 Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)

Preferred Option WSJ-5b represents the residential viewers to the north of Fauntleroy Way Southwest looking southeast across this major intersection (Figure 4-1b). The above-ground portion of the east and west station buildings would not add to the memorability of the view because it would blend into this view in architectural size and style. The intactness of the view would increase by replacing surface parking and strip retail buildings on both sides of the intersection. The station architecture would add to unity of the view by appearing more in common with the contemporary large-scale multi-family buildings and by mirroring the east and west buildings. The addition of the east and west entrance buildings would simplify an otherwise visually disconnected setting consisting of commercial, retail, and residential. The east and west station buildings would be a similar scale and height as the existing residential development. The vividness would remain as low average, and the intactness and unity would increase to low average, therefore increasing the overall visual quality to low average. This alternative would be a visual quality benefit.

Figure 4-1b. KOP WS-26: Preferred Option WSJ-5b

4.1.2.2 Elevated 41st/42nd Avenue Station Alternative (WSJ-1)

KOP WS-26 represents the residential sensitive viewers to the north of Fauntleroy Way Southwest looking south across this major intersection. While the elevated guideway with Alternative WSJ-1 would slightly add to the memorability of the view, this KOP is in a setting characterized by the visual disarray of a mix of commercial, retail, and residential (Figure 4-1c). The guideway would have a similar scale and height as the existing development and add to the complexity of the view. Therefore, the vividness would remain low average and the intactness and unity would remain low. The overall visual quality would remain low, which would not be a visual impact.

Figure 4-1c. KOP WS-26: Alternative WSJ-1

4.1.2.3 Elevated Fauntleroy Way Station Alternative (WSJ-2)

With Alternative WSJ-2, the guideway would be slightly lower but the vividness, intactness and unity would be very similar to WSJ-1 and not alter the visual quality from low (Figure 4-1d). The visual quality would remain low, which would not be a visual impact.

Figure 4-1d. KOP WS-26: Alternative WSJ-2

4.1.2.4 Tunnel 41st Avenue Alternative (WSJ-3a)

With Alternative WSJ-3a, the station building would be on the west side of this major intersection (Figure 4-1e). The station platform would be at the tunnel level and unseen in this view. This above-ground portion of the station would not add to the memorability of the view because it would blend into this setting with both architectural scale and style. Likewise, vividness would remain the same because the view of the hilltop and trees would remain. The intactness of the view would increase by replacing the strip retail buildings. The station building would add to unity of the view by appearing more in harmony with the contemporary large-scale multi-family buildings. The addition of the station would simplify an otherwise visually disconnected setting consisting of commercial, retail, and residential. The station building would be a similar scale, height, and bulk as the existing residential development. The view intactness and unity would improve to low average, therefore increasing the overall visual quality to low average. This alternative would be a visual quality benefit.

Figure 4-1e. KOP WS-26: Alternative WSJ-3a

4.1.2.5 Short Tunnel 41st Avenue Station Alternative (WSJ-4)

The influence of Alternative WSJ-4 on the visual quality of this view would be similar to that of Alternative WSJ-1 (Figure 4-1c) and Alternative WSJ-2 (Figure 4-1d). The average visual quality rating would remain low, which would not be a visual impact.

4.1.2.6 Medium Tunnel 41st Avenue Station Alternative (WSJ-5a)

The influence of Alternative WSJ-5a on the visual quality of this view would be similar to that of Preferred Option WSJ-5b (Figure 4-1b). The low visual quality rating would increase to low average, which would be a visual quality benefit.

4.2 KOP WS-27: 35th Avenue Southwest, Looking North at Intersection with Southwest Avalon Way

4.2.1 Existing Condition

KOP WS-27 was selected to represent the view looking north from the proposed Avalon Station location. The current view is predominantly transportation-based; elements of this include high traffic roadways, sidewalks, parking lots, and strip retail (Figure 42a). The overall intactness and unity of this view are low. The area includes residential sensitive viewers and commercial retail space. Signs, overhead utility poles and wire utilities are dominant in this view. The quality of the view is low.

Figure 4-2a. KOP WS-27: Existing Condition

4.2.2 Summary of Visual Quality Changes, by Alternative

Table 4-2 compares the ratings for visual quality components in the existing condition at KOP WS-27 with the ratings for each alternative. The visual changes related to each alternative are described in the following sections.

Table 4-2. KOP WS-27 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)	Elevated 41st/42nd Avenue Station Alternative (WSJ-1)	Elevated Fauntleroy Way Station Alternative (WSJ-2)	Tunnel 41st Avenue Station Alternative (WSJ-3a)	Short Tunnel 41st Avenue Station Alternative (WSJ-4)	Medium Tunnel 41st Avenue Station Alternative (WSJ-5a)
Vividness	Average	Average	Average	Average	Average	Average	Average
Intactness	Low	Low Average	Low Average	Low Average	Low Average	Low Average	Low Average
Unity	Low	Average	Average	Average	Average	Average	Average
Visual Quality	**Low**	**Average**	**Average**	**Average**	**Average**	**Average**	**Average**

Note: Alternative WSJ-4 would be the same as Alternative WSJ-1 and WSJ-2 and therefore was not simulated or included in the table. Alternative WSJ-3b would be the same as Alternative WSJ-3a, and Alternative WSJ-5a would be the same as Preferred Option WSJ-5b and therefore was not simulated or included in this table.

4.2.2.1 Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)

The view with Preferred Option WSJ-5b represents the neighborhood and residential sensitive viewers from south of Fauntleroy Way Southwest, along 35th Avenue Southwest at Southwest Avalon Way looking north across this major intersection. While the Preferred Option WSJ-5b would be in a tunnel configuration, the station (shown to the right on Figure 4-2b) would add to the memorability of the view. The preferred option alignment would be in an already visually high traffic area along a City of Seattle Designated Scenic Route consisting of a mix of commercial, retail, and residential district. The station, being a similar height, bulk, and scale as the existing adjacent development, would add distinctiveness; therefore, the vividness would increase to average. The intactness would increase slightly to low average, and the unity would increase to average due to the removal of some of the retail and parking lots, which would increase the integrity of the neighborhood and level of visual coherence. The overall visual quality would increase to average, which would be a visual quality benefit.

Figure 4-2b. KOP WS-27: Preferred Option WSJ-5b

4.2.2.2 Elevated 41st/42nd Avenue Station Alternative (WSJ-1)

This KOP represents the neighborhoods sensitive viewers and retail strip patrons with views to the north of Fauntleroy Way Southwest, along 35th Avenue Southwest at Southwest Avalon Way, looking north across this major intersection (Figure 4-2c). While the elevated guideway would add to the memorability of the view, this alternative would be in an already high traffic area along a City of Seattle Designated Scenic Route consisting of a mix of commercial, retail, and residential district. The removal of some of the retail and parking lots would reduce the amount of visual clutter. The guideway, with a similar scale and height as the existing development, would add to the complexity of the view; therefore, the vividness would remain as average. The intactness would slightly increase to low average based on the removal of visual distractions, and unity would slightly increase to average based on this alternative's increase in visual coherence. The overall visual quality would increase from low to average, which would be a visual quality benefit.

Figure 4-2c. KOP WS-27: Alternative WSJ-1

4.2.2.3 Elevated Fauntleroy Way Station Alternative (WSJ-2)

This view of Alternative WSJ-2 represents the neighborhoods residential viewers and retail strip patrons with views to the south of Fauntleroy Way Southwest at Southwest Avalon Way looking north across this major intersection (Figure 4-2d). While the elevated guideway would add to the memorability of the view, this alternative would be in an already visually high traffic area along a City of Seattle Designated Scenic Route consisting of a mix of commercial, retail, and residential district. The removal of some of the retail and parking lots would reduce the amount of visual clutter. The guideway, which would be a similar scale and height as the existing development, would add to the complexity of the view; therefore, the vividness would remain as average. The intactness would slightly increase to low average based on the removal of visual distractions, and unity would slightly increase to average visual quality based on this alternative providing an increase in visual coherence. The overall visual quality would increase from low to average, which would be a visual quality benefit.

Figure 4-2d. KOP WS-27: Alternative WSJ-2

4.2.2.4 Tunnel 41st Avenue Station Alternative (WSJ-3a)

The view of Alternative WSJ-3a from this KOP represents the neighborhoods sensitive viewers and retail strip patrons view from south of Fauntleroy Way Southwest at Southwest Avalon Way looking north across this major intersection (Figure 4-2e). While Alternative WSJ-3a would be a tunnel configuration, the station to the right of the image would add to the memorability of the view. This alternative is already in a visually high traffic area along a City of Seattle Designated Scenic Route consisting of a mix of commercial, retail, and residential district. The station would be similar in height, bulk, and scale as the existing adjacent development and would slightly increase the sense of distinctiveness; therefore, the vividness would increase to average. The intactness would increase slightly to low average, and the unity would increase to average based on the removal of some of the retail and parking lots, with a resulting increase in the integrity of the neighborhood and level of visual coherence. The overall visual quality would increase to average, which would be a slight improvement and would be considered a visual quality benefit.

Figure 4-2e. KOP WS-27: Alternative WSJ-3a

4.2.2.5 Short Tunnel 41st Avenue Station Alternative (WSJ-4)

The influence of Alternative WSJ-4 on the visual quality of this view would be similar to that of Alternative WSJ-1 (Figure 4-2c) and Alternative WSJ-2 (Figure 4-2d). The average visual quality rating would increase from low to average visual quality, which would be a visual quality benefit.

4.3 KOP WS-28: Southwest Genesee Street, Looking East toward Southwest Avalon Way

4.3.1 Existing Condition

KOP WS-28 was selected to represent views that residents along this portion of Southwest Genesee Street have when looking east toward Southwest Avalon Way. Single-family residences and a multi-story, multi-family building at the end of the street create a residential character (Figure 4-3a). The view is not especially memorable, and its vividness rating is average. Utility poles and tall trees are major vertical visual elements in this view. The view has a low average intactness rating due to the strong visual presence of the utility poles and lines running along and crossing the street in several places. The unity rating of the view is average, as is the visual quality rating.

Figure 4-3a. KOP WS-28: Existing Condition

4.3.2 Summary of Visual Quality Changes, by Alternative

Table 4-3 compares the ratings for visual quality components in the existing condition at KOP WS-28 with the ratings for each alternative. The visual changes related to these alternatives are described in the following section.

Table 4-3. KOP WS-28 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Elevated 41st/42nd Avenue Station Alternative (WSJ-1)	Elevated Fauntleroy Way Station Alternative (WSJ-2)	Short Tunnel 41st Avenue Station Alternative (WSJ-4)
Vividness	Average	High Average	High Average	High Average
Intactness	Low Average	Average	Average	Average
Unity	Average	High Average	High Average	High Average
Visual Quality	**Average**	**High Average**	**High Average**	**High Average**

Note:

Preferred Option WSJ-5b, Alternative WSJ-3a, Alternative WSJ-5a, and Alternative WSJ-6 would change the appearance of this area but to a lesser degree than Alternative WSJ-1 and therefore were not simulated or included on this table. Option WSJ-3b would not be seen from this view and therefore was not simulated or included in the table.

4.3.2.1 Elevated 41st/42nd Avenue Station Alternative (WSJ-1)

Residences along both sides of Southwest Genesee Street would be removed, and those on the south side of the street (right) would be replaced with an elevated guideway, support structures, and station (Figure 4-3b) with Alternative WSJ-1. The elevated guideway would continue east and remove the multi-story, multi-family buildings seen at the terminus of Southwest Genesee Street. The back of multi-story, multi-family buildings that face Southwest Avalon Way would be exposed with the removal of single-family residence and associated landscaping along the south side of Southwest Genesee Street. The visual character would partially change from residential to major transportation facility. With the extension of the elevated guideway to the east (especially the arched guideway), the memorability or vividness of this view would slightly increase to high average. The intactness of the view would remain average (if utility poles and lines are removed, it could increase to high average). The development of the station and its plaza along with the extension of the elevated guideway through the view would increase the visual unity rating of the view to high average. The average visual quality rating would slightly increase to high average which would be a visual quality benefit.

Figure 4-3b. KOP WS-28: Alternative WSJ-1

4.3.2.2 Elevated Fauntleroy Way Station Alternative (WSJ-2)

The influence of Alternative WSJ-2 on the visual quality of this view would be similar to that of Alternative WSJ-1 (Figure 4-3b). The average visual quality rating would slightly increase to high average.

4.3.2.3 Short Tunnel 41st Avenue Station Alternative (WSJ-4)

The influence of Alternative WSJ-4 on the visual quality of this view would be similar to that of Alternative WSJ-1 (Figure 4-3b). The average visual quality rating would slightly increase to high average.

4.4 KOP WS-29: Looking Southwest along Fauntleroy Way Southwest from 35th Avenue Southwest

4.4.1 Existing Condition

The location of KOP WS-29 is somewhat of an extended gateway into West Seattle because it represents the view seen by people approaching the Alaska Junction area after they exit the West Seattle Bridge. The view is along Fauntleroy Way Southwest as it passes through an area of primarily low-rise, commercial development (Figure 4-4a). Multi-story, mixed-use buildings in the Alaska Junction area are visible at the terminus of the street. The character of the view is commercial. Street trees along both sides of Fauntleroy Way Southwest obscure views beyond the street corridor and provide some visual unity. The view toward Alaska Junction is not memorable and has an average degree of vividness. Power lines and utility poles intrude on the view and somewhat decrease the intactness but not enough to reduce it to low average. The scale of the elements along Fauntleroy Way Southwest appears fairly uniform from KOP WS-29, and the development pattern is generally consistent. The unity rating of the view is average as is overall visual quality.

Figure 4-4a. KOP WS-29: Existing Condition

4.4.2 Summary of Visual Quality Changes, by Alternative

Table 4-4 compares the ratings for visual quality components in the existing condition at KOP WS-29 with the ratings for each alternative. The visual changes related to the alternatives are described in the following section.

Table 4-4. KOP WS-29 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Elevated 41st/42nd Avenue Station Alternative (WSJ-1)	Elevated Fauntleroy Way Station Alternative (WSJ-2)
Vividness	Average	Average	Average
Intactness	Average	Low	Low Average
Unity	Average	Low	Low Average
Visual Quality	**Average**	**Low**	**Low Average**

Note:

Preferred Option WSJ-5b, Alternative WSJ-3a, Option WSJ-3b, Alternative WSJ-4, Alternative WSJ-5a, and Alternative WSJ-6 would not be seen from this view and therefore were not simulated or included on this table.

4.4.2.1 Elevated 41st/42nd Avenue Station Alternative (WSJ-1)

The elevated guideway with Alternative WSJ-1 would pass next to and above KOP WS29 (Figure 4-4b). It would continue west toward Alaska Junction while straddling Fauntleroy Way Southwest. Although the vividness rating of the view would not change, the elevated guideway, straddle bents, and double row of guideway columns would be dissimilar in height, bulk, scale, form, color, and materials, and would visually encroach on the view. The average intactness rating would be reduced to low. The tunnel effect along Fauntleroy Way Southwest that would be created by the straddle bents and guideway columns would lower the average unity rating to low by disrupting the existing average harmony and visual pattern of the existing view. The existing overhead power lines would be undergrounded, which would not alter the visual quality. The average visual quality rating would be reduced to low, which would be a visual impact.

Figure 4-4b. KOP WS-29: Alternative WSJ-1

4.4.2.2 Elevated Fauntleroy Way Station Alternative (WSJ-2)

Although the elevated guideway and one straddle bent would be very close to and visible from KOP WS-29 with Alternative WSJ-2, on the north (right) side of Fauntleroy Way Southwest, this alternative would follow the street direction and maintain a degree of visual intactness, although the rating would be reduced from average to low average (Figure 4-4c). The existing overhead power lines would be undergrounded, which would not alter the visual quality. By following the existing street pattern and creating an open area next to Fauntleroy Way Southwest under the elevated guideway, the unity of the view would not be decreased as much as it would be with different alternatives in this segment. The unity rating would decrease to low average, as would the visual quality rating, which would not be a visual impact.

Figure 4-4c. KOP WS-29: Alternative WSJ-2

4.5 KOP WS-30: 39th Avenue Southwest, Looking South toward Fauntleroy Way Southwest

4.5.1 Existing Condition

KOP WS-30 represents views that residents on the slope north of Fauntleroy Way Southwest have when looking south toward Alaska Junction. The view includes a major intersection in West Seattle; a gas station; a multi-story, multi-family building; Fauntleroy Way Southwest where it angles to the southwest at the junction; a tower crane (a temporary feature); and a hillside beyond the junction (Figure 4-5a). This visually busy and transitioning area has a mixed character. The most distinctive feature in this view is the prominent hillside beyond the intersection. However, even with the hillside, the view is not unusually memorable, and its vividness rating is average. The view has an average degree of intactness. With the mixture of uses and building types that can be viewed, the unity of the view is low average. The visual quality rating of the view is average.

Figure 4-5a. KOP WS-30: Existing Condition

4.5.2 Summary of Visual Quality Changes, by Alternative

Table 4-5 compares the ratings for visual quality components in the existing condition at KOP WS-30 with the ratings for Alternative WSJ-2. The visual changes related to this alternative are described in the following section.

Table 4-5. KOP WS-30 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Elevated Fauntleroy Way Station Alternative (WSJ-2)
Vividness	Average	High Average
Intactness	Average	High Average
Unity	Low Average	Average
Visual Quality	**Average**	**Average**

Note:

Preferred Option WSJ-5b, Alternative WSJ-1, Alternative WSJ-3a, Option WSJ-3b, Alternative WSJ-4, Alternative WSJ-5a, and Alternative WSJ-6 would not be seen from this view and therefore were not simulated or included on this table.

4.5.2.1 Elevated Fauntleroy Way Station Alternative (WSJ-2)

The Alternative WSJ-2 elevated station and guideway would add more memorable elements in this view than the mix of land uses and buildings that are currently seen (Figure 4-5b). The vividness of the view would increase from average to high average. The height and scale of the elevated station would be compatible with nearby buildings and this setting in general. The existing overhead power lines would be undergrounded, which would not alter the visual quality. Although the elevated guideway might encroach on views from residential sensitive viewers farther down Fauntleroy Way Southwest, this alternative's components would improve the intactness of the view and increase the rating to high average. The elevated station and guideway would follow the street pattern in this location, simplify and harmonize the intersection area compared to the existing condition, and increase the low average unity rating to average. The visual quality rating would remain average, which would not be a visual impact.

Figure 4-5b. KOP WS-30: Alternative WSJ-2

4.6 KOP WS-31: 42nd Avenue Southwest near Southwest Hudson Street, Looking North

4.6.1 Existing Condition

KOP WS-31 represents the view north along 42nd Avenue Southwest that is seen by residents in this neighborhood. Single-family residences, street trees, and large trees in the yards of residences are the primary visual elements of this view (Figure 4-6a). The area viewed from this location is residential in character. The view is of a pleasant but unremarkable residential area that has an average degree of vividness. The intactness and unity of this area are high average. The area viewed has high average visual quality rating.

Figure 4-6a. KOP WS-31: Existing Condition

4.6.2 Summary of Visual Quality Changes, by Alternative

Table 4-6 compares the ratings for visual quality components in the existing condition at KOP WS-31 with the ratings for Alternative WSJ-1. The visual changes related to this alternative are described in the following section.

Table 4-6. KOP WS-31 Visual Quality Changes by Alternative

Visual Quality Components	Existing	Elevated 41st/42nd Avenue Station Alternative (WSJ-1)
Vividness	Average	Average
Intactness	High Average	Low
Unity	High Average	Low
Visual Quality	**High Average**	**Low**

Notes:

Option WSJ-3b would not be seen from this view and therefore, was not simulated or included in this table. Changes associated with the construction of Option WSJ-3b would alter the appearance of this view (but were not simulated or included in this table because simulations show long-term permanent impacts).

In addition, Preferred Option WSJ-5b, Alternative WSJ-2, Alternative WSJ-3a, Alternative WSJ-4, Alternative WSJ-5a, and Alternative WSJ-6 would not be seen from this view and therefore were not simulated or included in this table.

4.6.2.1 Elevated 41st/42nd Avenue Station Alternative (WSJ-1)

All of the residences along 41st Avenue Southwest that are visible in Figure 4-6a would be removed with Alternative WSJ-1 (Figure 4-6b). The elevated guideway, the elevated trail track, stored trains, and the high access would introduce large-scale elements into the view that would be very different visually, and somewhat more memorable, than the existing view. The change would not be enough to change the vividness rating to high average however, so it would remain average. The project components would contrast with the existing view in terms of height, bulk, scale, form, color, and material, and would be encroachments into the view. The high average intactness of the view would be reduced to low. The project elements do not fit the pattern of the area near them, contrast with nearby residential areas, and do not support a harmonious visual setting. As a result, the unity rating of view would be reduced to low. The visual quality rating would also be reduced to low, which would be a visual impact.

Attachment N.2B
Station 3D Views and Cross Sections

To show the height, bulk, and scale of the stations in Delridge and the West Seattle Junction, segments, this attachment includes generalized cross sections of each station. In addition, 3D views of some of the stations are also shown as representative examples of the height, bulk, and scale for higher and lower alternatives. The 3D views also identify potential sites for transit-oriented development (TOD).

1 INTRODUCTION

1.1 Overview

Central Puget Sound Regional Transit Authority (Sound Transit) is proposing to expand Link light rail transit service from SODO to West Seattle. The West Seattle Link Extension Project (the project) is a 4.1-mile corridor in the city of Seattle in King County, Washington, the most densely populated county of the Puget Sound region (Figure 1-1). The project would include stations at SODO, Delridge, Avalon, and Alaska Junction. The project is part of the Sound Transit 3 Plan of regional transit system investments, funding for which was approved by voters in the region in 2016.

The Draft Environmental Impact Statement (EIS) published in January 2022 evaluated both the West Seattle Link Extension and the Ballard Link Extension together as one West Seattle and Ballard Link Extensions (WSBLE) Project. The extensions were evaluated together in the WSBLE Draft EIS because of their location, schedule, and review efficiencies for partner agencies.

In July 2022, the Sound Transit Board directed that further studies be prepared for the Ballard Link Extension, to evaluate additional station options and other refinements (Motion M2022-57). Some of these project options and refinements require additional conceptual engineering and environmental review. Rather than delay completion of the environmental review process for the West Seattle Link Extension while additional review is conducted for the Ballard Link Extension, Sound Transit and Federal Transit Administration (FTA) have decided to move forward under separate environmental reviews for each extension.

As described in the WSBLE Draft EIS, the two extensions will operate as separate lines, and the extensions are standalone projects with independent utility. Proceeding with separate environmental review processes for each extension enables Sound Transit and FTA to minimize delay in delivering the West Seattle Link Extension while further analysis is undertaken on the Ballard Link Extension. Accordingly, this Final EIS is for the West Seattle Link Extension only. The Ballard Link Extension will undergo separate environmental review, building on the analysis that has already been completed.

Figure 1-1. West Seattle Link Extension Project Corridor

The West Seattle Link Extension would provide fast, frequent, and reliable light rail in Seattle and connect dense residential and job centers throughout the Puget Sound region. The Puget Sound Regional Council (the regional metropolitan planning organization) and the City of Seattle have designated the following Manufacturing/Industrial Center and urban village in the project corridor:

- **Manufacturing/Industrial Center.** The project corridor includes the Duwamish Manufacturing/ Industrial Center. SODO Station is in the Duwamish Manufacturing/Industrial Center.
- **Urban Village.** West Seattle Junction is a neighborhood in the project corridor designated by the City of Seattle as an urban village. The Alaska Junction and Avalon stations are in the West Seattle Junction Urban Village.

Puget Sound Regional Council

Puget Sound Regional Council, the regional metropolitan planning organization, develops policies and coordinates decisions about regional growth, transportation, and economic development planning within King, Kitsap, Pierce, and Snohomish counties. Puget Sound Regional Council is composed of over 80 jurisdictions, including all four counties; cities and towns; ports; state and local transportation agencies; and tribal governments within the region.

These designations indicate that these areas will continue to increase in residential and/or employment density over the next 30 years.

Existing local transit connections in the project corridor include bus and light rail. The King County Metro Transit (Metro) RapidRide C bus line currently provides service between West Seattle, Downtown Seattle, and South Lake Union. The RapidRide H bus line provides service between Burien and Downtown Seattle via Delridge. Other local bus service also operates in the project corridor.

Regional transit service in the project corridor includes regional bus service, ferry service, light rail, Sounder commuter rail, and Amtrak passenger rail service. Light rail currently operates between the Angle Lake Station in the city of SeaTac and Northgate Station in Seattle, traveling

through the Downtown Seattle Transit Tunnel. There is an existing light rail station in SODO in the West Seattle Link Extension Corridor.

Extensions of light rail are under construction north to Lynnwood, east to Bellevue and Redmond, and south to Federal Way, all of which are anticipated to be operational by 2026. Additional planned light rail extensions would continue south to the Tacoma Dome, expected to begin service in 2035, and north to Everett, planned to begin service between 2037 and 2041. The Ballard Link Extension is scheduled to begin service between SODO and Ballard in 2039. The West Seattle Link Extension is scheduled to open in 2032 and would include a new SODO station where riders to and from West Seattle could transfer to the existing SODO station and light rail system until the Ballard Link Extension begins operation. The Ballard Link Extension would permanently connect the West Seattle Link Extension to the existing 1 Line, allowing riders to continue north to Everett. Figure 1-2 shows the full system planned for operation in 2042 under the target schedule. Table 1-1 lists the project Build Alternatives.

Figure 1-2. Link Light Rail System Expansion

1.2 Purpose of Report

The purpose of this report is to document noise and vibration in the project vicinity and evaluate potential impacts associated with the proposed alternatives. This report covers both noise and vibration in the study area.

Table 1-1. Summary of West Seattle Link Extension Build Alternatives

Segment	Alternatives and Design Options	Abbreviation	Stations (and Station Profile)	Connections
SODO	**Preferred At-Grade Lander Access Station Option**	**SODO-1c**	**SODO (At-Grade)**	**All Duwamish Segment alternatives.**
SODO	At-Grade Alternative	SODO-1a	SODO(At-Grade)	All Duwamish Segment alternatives.
SODO	At-Grade South Station Option	SODO-1b	SODO (At-Grade)	All Duwamish Segment alternatives.
SODO	Mixed Profile Alternative	SODO-2	SODO (Elevated)	All Duwamish Segment alternatives.
Duwamish (DUW)	**Preferred South Crossing Alternative**	**DUW-1a**	**None**	**All SODO Segment alternatives. All Delridge Segment alternatives.**
Duwamish (DUW)	South Crossing South Edge Crossing Alignment Option	DUW-1b	None	All SODO Segment alternatives. All Delridge Segment alternatives.
Duwamish (DUW)	North Crossing Alternative	DUW-2	None	All SODO Segment alternatives. All Delridge Segment alternatives.
Delridge (DEL)	**Preferred Andover Street Station Lower Height South Alignment Option**	**DEL-6b**	**Delridge (Elevated)**	**All Duwamish Segment alternatives. Connects to WSJ-5a and WSJ-5b.**
Delridge (DEL)	Dakota Street Station Alternative	DEL-1a	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-1, WSJ-2, and WSJ-4.
Delridge (DEL)	Dakota Street Station North Alignment Option	DEL-1b	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-1, WSJ-2, and WSJ-4.
Delridge (DEL)	Dakota Street Station Lower Height Alternative	DEL-2a	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-3a and WSJ-3b.
Delridge (DEL)	Dakota Street Station Lower Height North Alignment Option	DEL-2b	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-3a and WSJ-3b.
Delridge (DEL)	Delridge Way Station Alternative	DEL-3	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-1, WSJ-2, and WSJ-4.
Delridge (DEL)	Delridge Way Station Lower Height Alternative	DEL-4	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-3a and WSJ-3b.

Segment	Alternatives and Design Options	Abbreviation	Stations (and Station Profile)	Connections
Delridge (DEL)	Andover Street Station Alternative	DEL-5	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-1, WSJ-2, and WSJ-4.
Delridge (DEL)	Andover Street Station Lower Height Alternative	DEL-6a	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-5a and WSJ-5b.
Delridge (DEL)	Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative	DEL-7	Delridge (Elevated)	All Duwamish Segment alternatives. Connects to WSJ-6.
West Seattle Junction (WSJ)	**Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option**	**WSJ-5b**	**Avalon (Retained Cut), Alaska Junction (Tunnel)**	**Connects to DEL-6a and DEL-6b.**
West Seattle Junction (WSJ)	Elevated 41st/42nd Avenue Station Alternative	WSJ-1	Avalon (Elevated), Alaska Junction (Elevated)	Connects to DEL-1a, DEL-1b, DEL-3, and DEL-5.
West Seattle Junction (WSJ)	Elevated Fauntleroy Way Station Alternative	WSJ-2	Avalon (Elevated), Alaska Junction (Elevated)	Connects to DEL-1a, DEL-1b, DEL-3, and DEL-5.
West Seattle Junction (WSJ)	Tunnel 41st Avenue Station Alternative	WSJ-3a	Avalon (Tunnel), Alaska Junction (Tunnel)	Connects to DEL-2a, DEL-2b, and DEL-4.
West Seattle Junction (WSJ)	Tunnel 42nd Avenue Station Option	WSJ-3b	Avalon (Tunnel), Alaska Junction (Tunnel)	Connects to DEL-2a, DEL-2b, and DEL-4.
West Seattle Junction (WSJ)	Short Tunnel 41st Avenue Station Alternative	WSJ-4	Avalon (Elevated), Alaska Junction (Tunnel)	Connects to DEL-1a, DEL-1b, DEL-3, and DEL-5.
West Seattle Junction (WSJ)	Medium Tunnel 41st Avenue Station Alternative	WSJ-5a	Avalon (Retained Cut), Alaska Junction (Tunnel)	Connects to DEL-6a and DEL-6b.
West Seattle Junction (WSJ)	No Avalon Station Tunnel Alternative	WSJ-6	Alaska Junction (Tunnel)	Connects to DEL-7.

2 ENVIRONMENTAL NOISE AND VIBRATION BASICS

2.1 Noise Fundamentals and Descriptors

2.1.1 Understanding Sound

What humans perceive as sound is a series of continuous air pressure fluctuations superimposed on the atmospheric pressure that surrounds us. The amplitude of fluctuation is related to the energy carried in a sound wave; the greater the amplitude, the greater the energy, and the louder the sound. The full range of sound pressures encountered in the world is so great that it is more convenient to compress the range by using a logarithmic scale, resulting in the fundamental descriptor used in acoustics—the sound pressure level, which is measured in decibels (dB). When sounds are unpleasant, unwanted, or disturbingly loud, one tends to classify them as noise.

Another aspect of sound is the quality described as its pitch. Pitch of a sound is established by the frequency, which is a measure of how rapidly a sound wave fluctuates. The unit of measurement is cycles per second, called hertz. When a sound is analyzed, its energy content at individual frequencies is displayed over the frequency range of interest, usually the range of human audibility from 20 to 20,000 hertz. This display is called a frequency spectrum.

Sound is measured using a sound level meter with a microphone designed to respond accurately to all audible frequencies. However, the human hearing system does not respond equally to all frequencies. Low-frequency sounds below about 400 hertz are progressively and severely attenuated, as are high frequencies above 10,000 hertz. To approximate the way humans interpret sound, a filter circuit with frequency characteristics similar to the human hearing mechanism is built into sound level meters. Measurements with this filter enacted are called A-weighted sound levels, expressed in A-weighted decibels (dBA). Community noise is usually characterized in terms of the A-weighted sound level.

The range of human hearing extends from about 0 dBA for young healthy ears (that have not been exposed to loud noise sources) to about 140 dBA. When sounds exceed 110 dBA, there is a potential for hearing damage, even with relatively short exposures. In quiet suburban areas far from major freeways, the noise levels during the late-night hours will drop to about 30 dBA. Outdoor noise levels lower than this only occur in isolated areas where there is a minimum amount of natural noises, such as leaves blowing in the wind, crickets, or flowing water. Table 2-1 provides a list of different sounds, activities and transportation noise sources and the maximum noise levels typically experienced in dBA.

Another characteristic of environmental noise is that it is constantly changing. The noise level increasing when a train passes is an example of a short-term change. The lower average noise levels occur during nighttime hours, when activities are at a minimum, with higher noise levels during daytime hours caused by daily patterns of noise-level fluctuation. The instantaneous A-weighted sound level is insufficient to describe the overall acoustic environment. Thus, it is common practice to condense the fluctuating noise levels into a single number, called the equivalent sound level (Leq).

Table 2-1. Examples of Common Noise Sources and General Noise Levels

Maximum Noise Level (approximate)	Examples of Sounds, Activities, and Transportation Noise Sources, Quietest to Loudest
25 to 30 dBA	Acoustic test chamber Quiet, rural area at night, crickets or wind noise, no traffic
30 to 40 dBA	Quiet bedroom with no air systems running Empty recording studio
40 to 50 dBA	Quiet window air conditioner, indoors Background noise inside a typical office space
50 to 60 dBA	Normal conservation, two people at 4 to 6 feet Typical television volume at 10 feet
60 to 70 dBA	Automobile cruising, 50 miles per hour, 50 feet Heated conservation, two to four people, 4 to 6 feet
70 to 80 dBA	Vanpool bus cruising, 50 miles per hour, 50 feet Medium truck (parcel delivery trucks) at 50 miles per hour, 50 feet
86 dBA	Link light rail, 4-car train traveling at 55 miles per hour, measured at 50 feet
80 to 90 dBA	Overland bus cruising, 50 miles per hour, 50 feet Accelerating heavy loaded truck, 50 feet
90 to 100 dBA	Multiple locomotives pulling 5000 feet train. 40 miles per hour, 100 feet Loud shop tools (router, table saw), 5 feet
Over 100 dBA	Loud crowd at an indoor basketball game Freight train horn at 100 feet Jet takeoff at 250 feet

Source: Adapted from FTA (2018) and measured noise levels. Link light rail noise levels from measurements in 2018 and 2019.

Leq can be thought of as the steady sound level that represents the same sound energy as the varying sound levels over a specified time period (typically 1 hour or 24 hours). Often the Leq values over a 24-hour period are used to calculate cumulative noise exposure in terms of the day-night equivalent sound level (Ldn), which is defined as the 24-hour Leq but with a 10-dB penalty added to each nighttime hourly Leq (with nighttime defined as the period from 10 p.m. to 7 a.m.). The effect of this penalty is that any event during the nighttime is equivalent to 10 events during the daytime. This strongly weights Ldn toward nighttime noise to reflect most people being more easily annoyed by noise at night when background noise is lower, and most people are resting.

Environmental impact assessments for mass transit projects in the United States typically use Ldn to describe the community noise environment at residential locations. Studies of community response to a wide variety of noises indicate that Ldn is a good measure of the noise environment. Table 2-2 defines typical community noise levels in terms of Ldn. Most urban and suburban neighborhood Ldn noise levels range from 50 to 70 dBA. An Ldn of 70 dBA is a relatively noisy environment that might be found at buildings on a busy surface street, close to a freeway, or near a busy airport and would usually be considered unacceptable for residential land use without special measures taken to enhance outdoor-indoor sound insulation. Residential neighborhoods that are not near major sound sources are usually in the range of Ldn 55 to 60 dBA. If there is a freeway or moderately busy arterial nearby, or any nighttime noise, Ldn is usually in the range of 60 to 65 dBA.

Table 2-2. Typical 24-hour Day-night Sound Levels and Land Use Compatibility

Day-Night Equivalent Noise Level in A-weighted Decibels	Description of Typical and Acceptable Land Use
Ldn below 50 dBA	Typically found in rural areas with no major roadways or other major noise sources nearby. Compatible with all noise-sensitive properties.
Ldn of 50 to 55 dBA	Typically found in quiet suburban residential neighborhoods not near any major roadways and with little nighttime activity. Compatible with all noise-sensitive properties.
Ldn of 55 to 60 dBA	Typically found in many residential areas with minor arterial roadways nearby, typical of many close in suburban and some urban residential areas. Compatible with all noise-sensitive properties.
Ldn of 60 to 65 dBA	Relatively noisy residential area. Usually a major road or airport is nearby. Considered normally acceptable for residential land use.
Ldn of 65 to 70 dBA	Noise levels in this range are typical for a noisy residential area that is close to a major freeway or the end of an airport runway. Considered marginally acceptable for a residential area.
Ldn of 70 to 75 dBA	Typical for areas directly adjacent to a major freeway or very near an airport. Not normally acceptable for residential use without noise mitigation measures.
Ldn greater than 75 dBA	Noise levels above 75 dBA Ldn are not acceptable for residential use and are only found near the ends of airport runways and adjacent to major highways.

Source: Adapted from FTA 2018.

Ldn is the designated noise metric of choice for many federal agencies, including the Department of Housing and Urban Development, Federal Aviation Administration, FTA, and United States Environmental Protection Agency. Most federal and state agency criteria for noise impacts are based on some measurement of noise energy. For example, the Federal Aviation Administration and Department of Housing and Urban Development use Ldn and the Federal Highway Administration uses peak hour Leq. The noise impact criteria applicable to residential areas is included in the 2018 *FTA Transit Noise and Vibration Impact Assessment Manual* (FTA Guidance Manual) (FTA 2018) and uses both Leq and Ldn to characterize community noise.

2.1.2 Calculating Decibels

An important factor to recognize is that noise is measured on a decibel scale, and calculating the sound level for two noise sources is not achieved by simple addition. For example, combining two 60-dB noise sources does not give 120 dB (which is near the pain threshold), but yields 63 dB, which is lower than the volume at which most people listen to their TVs. For reference, if two noise sources are 10 dB apart, for example 50 dB and 60 dB, the sum of the two noise levels will simply be the louder of the two, in this case 60 dB. This is to say that for similar noise sources that are 10 dB apart in magnitude, a person would only be able to hear the louder of the two sources.

Examples of simplified decibel addition, based on the difference between the two levels, are provided in Table 2-3 for reference, to aid in the understanding of the total project noise and impact analysis presented in this report.

Table 2-3. Decibel Addition Approximations

Difference between the Two Noise Sources	Amount Added to the Higher of the Two Noise Levels
0 to 1 dB	3 dB
2 to 3 dB	2 dB
4 to 9 dB	1 dB
10 dB or more	0 dB

This information is important when considering the FTA criteria and what the total noise (existing and light rail noise) would be at any location. An increase of less than 3 dB is not typically perceptible to an average person. For example, if noise from light rail operations is 4 dB to 9 dB below the existing noise levels, the project-related increase in the total noise (light rail plus existing) would be approximately 1 dB or less, an increase which is not perceptible to an average person.

2.2 Vibration Fundamentals and Descriptors

Vibration is an oscillatory motion that is described in terms of the displacement, velocity, or acceleration of the motion. The response of humans to vibration is very complex. However, the general consensus is that for the vibration frequencies generated by light rail trains, human response is best approximated by the vibration velocity level. Therefore, this study uses vibration velocity to describe light rail-generated vibration levels.

One potential community impact from a project like the West Seattle Link Extension is vibration that is transmitted from the tracks through the ground to adjacent buildings. This is referred to as groundborne vibration. When evaluating human response, groundborne vibration is expressed in terms of decibels using the root mean square vibration velocity. Root mean square is defined as the square root of the average of the squared amplitude of the vibration signal. To avoid confusion with sound decibels, the abbreviation VdB is used for vibration velocity decibels. All vibration decibels in this report use a decibel reference of 1 micro-inch per second.

The potential impacts of rail transit groundborne vibration are as follows:

- Perceptible building vibration: The vibration of the floor or other building surfaces that the occupants feel.
- Rattle: The building vibration can cause rattling of items on shelves and hangings on walls, and various rattle and buzzing noises from windows and doors.
- Reradiated noise: The vibration of room surfaces radiates sound waves that are audible to humans (groundborne noise). Groundborne noise sounds like a low-frequency rumble. Usually, for a surface rail system such as the light rail train, the groundborne noise is masked by the normal airborne noise radiated from the transit vehicle and the rails.

Table 2-4 presents typical vibration levels from rail and non-rail sources, as well as the human and structural response to such levels.

Although there is relatively little research into human and building response to groundborne vibration, there is substantial experience with vibration from rail systems. In general, the collective experience indicates the following:

- It is rare that groundborne vibration from transit systems results in building damage, even minor cosmetic damage. Therefore, the primary consideration is whether or not the vibration is intrusive to building occupants or interferes with interior activities or machinery.
- The threshold for human perception is approximately 65 VdB. Vibration levels in the range of 70 to 75 VdB often are noticeable but acceptable. Beyond 80 VdB, vibration levels are considered unacceptable.
- For human annoyance, there is a relationship between the number of daily events and the degree of annoyance caused by groundborne vibration. The FTA Guidance Manual includes an 8-VdB higher impact threshold if there are fewer than 30 events per day and a 3-VdB higher threshold if there are fewer than 70 events per day (FTA 2018).

Table 2-4. Typical Vibration Level in Decibels and Human/Structural Responses

Vibration Level in VdB	Description of Typical Sources 50 Feet from Source and Human/Structural Response
Below 60 VdB	Typical background vibration levels.
60 to 70 VdB	Light rail transit on a normal track; bus or truck on a smooth roadway. Approximate threshold of human perception and limit for vibration-sensitive equipment.
70 to 80 VdB	Light rail transit near a crossover; bus or truck over pothole. Residential annoyance from infrequent events (e.g., commuter trains), residential annoyance from occasional events, and residential annoyance from frequent events (e.g., light rail transit).
80 to 90 VdB	Bulldozers and other heavy tracked vehicles and freight trains. The typical human response would be difficulty with tasks such as reading a computer screen.
90 to 100 VdB	Blasting from construction projects. This is the threshold for minor cosmetic damage.

Source: Adapted from FTA 2018.

Often it is necessary to determine the contribution at different frequencies when evaluating vibration or noise signals. The 1/3-octave band spectrum is the most common method used to evaluate frequency components of acoustic signals. The term octave is borrowed from music, where it refers to a span of eight notes. The ratio of the highest frequency to the lowest frequency in an octave is 2:1. For a 1/3-octave band spectrum, each octave is divided into three bands, where the ratio of the lowest frequency to the highest frequency in each 1/3-octave band is 2 1/3:1 (1.26:1). An octave consists of three 1/3 octaves. The 1/3-octave band spectrum of a signal is obtained by passing the signal through a bank of filters. Each filter excludes all components except those that are between the upper and lower range of one 1/3-octave band (FTA 2018).

This page is intentionally left blank.

3 NOISE AND VIBRATION IMPACT CRITERIA

This section summarizes the noise and vibration criteria used to evaluate the operations and construction of the project. Criteria from the FTA, Federal Highway Administration, Washington State Department of Transportation (WSDOT) and the City of Seattle are included and discussed as required for this environmental analysis.

3.1 Noise Criteria

The operation of a light rail system can cause noise that becomes a public concern. Noise impacts can be caused by either transit operations (e.g., light rail operational noise, warning bells, and ancillary facilities) or changes in traffic noise exposure. The major noise source for the project would be noise from Link light rail operations, as well as some additional noise from stations. An increase in traffic noise exposure could result from the development of new or extended roadways in station areas or from the removal of buildings, walls, or berms that currently provide acoustical shielding from traffic noise.

Noise from project-related ancillary facilities can also be a source of noise; these would include maintenance and cleaning facilities, power substations, park-and-rides, and tunnel exhaust fan systems. The maintenance and cleaning facilities for operations of the project will be at the existing Operations and Maintenance Facility Central. No park-and-rides are proposed as part of this project; therefore, no noise analysis for park-and-rides was needed. Substations and tunnel exhaust fans are enclosed in buildings with acoustically treated ventilation systems and are designed to maintain noise levels well below any applicable state or local noise criteria.

There are several different noise impact criteria applicable to the project. Criteria from the FTA, Federal Highway Administration, WSDOT, and the City of Seattle were all reviewed and applied as appropriate to this analysis. This section summarizes those criteria and defines the project noise impact criteria applicable to the project.

3.1.1 Transit Noise Criteria

Noise impacts for the project are determined based on the criteria defined in the FTA Guidance Manual (FTA 2018). The FTA noise impact criteria are founded on well-documented research on community reaction to noise and are based on changes in noise exposure rated using a sliding scale. Although more transit noise is allowed in neighborhoods with high levels of existing noise, as existing noise levels increase, smaller increases in total noise exposure are allowed than in areas with lower existing noise levels. The FTA noise impact criteria group noise-sensitive land uses into the following three categories:

- **Category 1**: Tracts of land where quiet is an essential element in their intended purpose. This category includes lands set aside for serenity and quiet and such land uses as outdoor amphitheaters and concert pavilions, as well as National Historic Landmarks with significant outdoor use. Also included in this category are recording studios and concert halls.
- **Category 2**: Residences and buildings where people normally sleep. This category includes homes, hospitals, and hotels where a nighttime sensitivity to noise is assumed to be of utmost importance.

- **Category 3**: Institutional land uses with primarily daytime and evening use. This category includes schools, libraries, theaters, and places of worship where it is important to avoid interference with such activities as speech, meditation, and concentration on reading material. Places for meditation or study associated with cemeteries, monuments, museums, campgrounds, and recreational facilities are also considered to be in this category. Certain historical sites and parks are also included, but their sensitivity to noise must be related to their defining characteristics, and generally parks with active recreational facilities are not considered noise-sensitive.

Ldn is used to characterize noise exposure for residential areas (Category 2). For other noise-sensitive land uses, such as outdoor amphitheaters and school buildings (Categories 1 and 3), the maximum 1-hour Leq during the facility's operating period is used.

The two levels of impact included in the FTA criteria (moderate and severe) are as follows:

- **Moderate Impact**: In this range of noise impact, the change in the cumulative noise level is noticeable to most people but may not be sufficient to cause strong, adverse reactions from the community. In this transitional area, other project-specific factors must be considered to determine the magnitude of the impact and the need for mitigation. These factors include the existing level, the projected level of increase over existing noise levels, the types and numbers of noise-sensitive land uses affected, the noise sensitivity of the properties, the effectiveness of the mitigation measures, community views, and the cost of mitigating noise to more acceptable levels.
- **Severe Impact**: Project-generated noise in the severe impact range can be expected to cause a large percentage of people to be highly annoyed by the new noise and represents the most compelling need for mitigation. Noise mitigation will normally be specified for severe impact areas unless there are truly extenuating circumstances that prevent mitigation.

The FTA noise impact criteria for Category 2 and Category 3 land uses are summarized in Tables 3-1 and 3-2, which show the existing noise exposure and the allowable noise exposure from a transit project that would cause either moderate or severe impact. The future noise exposure would be the combination of the existing noise exposure and the additional noise exposure caused by the light rail project. As existing noise exposure increases, an increasingly smaller increase in noise is permitted before an impact occurs.

Given the complex nature of these criteria, an example of the application of the criteria can be helpful in understanding how impacts are identified. For example, a residential land use (FTA Category 2) with an existing Ldn of 65 dBA would have no impact if noise from light rail operations were below 61 dBA Ldn, a moderate impact if the light rail noise were between 61 and 66 dBA, and a severe impact if light rail noise were above 66 dBA (Table 3-1). This example shows how the light rail noise level could be *lower* than the *existing* noise levels, and still result in a noise impact. The example also demonstrates how the FTA criteria help to prevent increasing noise levels in areas that already have high levels of background noise. Furthermore, using the information from Table 2-3 (Decibel Addition Approximations), if the light rail operations were, for example, 62 dBA Ldn, the total future noise (existing 65 dBA Ldn plus the light rail's 62 dBA Ldn) would be approximately 67 dBA Ldn, or a 2-dB increase, which is not typically perceptible to an average person but would be an impact under FTA criteria.

The FTA Guidance Manual provides details on how parks are analyzed for noise. The FTA assumes that parks are a special case, and how they are used and where they are located should be considered when considering whether or not a particular park (or an area in a park) is considered noise-sensitive. Parks that are used for active outdoor recreation are typically not considered noise-sensitive. This includes parks with baseball diamonds, soccer fields, basketball courts, football fields, and other active recreation areas.

Table 3-1. FTA Transit Project Noise Impact Criteria for Category 1 and 2 Sites

Existing Noise Exposure Ldn or Leq (dBA) [a]	Transit Noise Level for No Noise Impact	Transit Noise Level for a Moderate Noise Impact	Transit Noise Level for a Severe Noise Impact
<43	<Ambient +10	Ambient +10 to 15	>Ambient +15

Parks that are noise-sensitive would be those where quiet is an essential element in their intended purpose or places where it is important to avoid interference with activities such as speech, meditation, and reading. The existing noise levels at a park can provide some indication of the sensitivity of its use. All parks along the West Seattle Link Extension corridor were evaluated for consideration under the FTA criteria and, based on the park locations and existing noise levels, only those parks in quiet areas without active sports met the requirements for noise sensitivity under the FTA Category 3 criteria. Noise-sensitive parks include the Longfellow Creek Natural Area in the Delridge Segment. All other parks are in areas with high existing noise levels or are active sports fields. Additional information on parks as related to noise and vibration is provided in Chapter 5, Affected Environment.

3.1.2 Traffic Noise Criteria

Criteria for traffic noise impacts are from the Federal Highway Administration Procedures for Abatement of Highway Traffic Noise and Construction Noise, Code of Federal Regulations Title 23, Subchapter H, Section 772 (1982). A traffic noise impact occurs if predicted traffic noise levels approach the criteria levels for specific land use categories or substantially exceed existing noise levels (e.g., a 10-dBA increase). These levels are defined as noise abatement criteria and are based on hourly Leq levels for the peak hour of traffic noise. The Federal Highway Administration has land use categories that are similar to the ones used by the FTA, although the Federal Highway Administration categories use letters instead of numbers. The land uses of greatest concern in the project corridor are Federal Highway Administration Type B and Type C land uses, which include residences, playgrounds, active sports areas, parks, schools, places of worship, libraries, and hospitals. Hotels, motels, offices, restaurants and bars, and other developed lands are included in Federal Highway Administration Type E land use category and have a higher impact level than Federal Highway Administration Types B and C land use. The noise abatement criterion used to determine impacts on Federal Highway Administration Types B and C land use is 67 dBA Leq, and for Type E land use the criteria is 72 dBA Leq. Under WSDOT policy, a traffic noise impact occurs if predicted noise levels are within 1 dB of the noise abatement criteria. Therefore, an impact on Type B and Type C land uses would occur at 66 dBA, and at 71 dBA Leq for Type E land use.

WSDOT is responsible for implementing the Federal Highway Administration regulations in Washington state. Under Federal Highway Administration and WSDOT regulations, any highway project receiving federal funds must have a noise analysis if it includes elements including new roadway or highway, substantial alteration of the alignment of an existing roadway or highway, or adding new capacity to an existing roadway or highway. The removal of physical shielding (e.g., building or topographical conditions), which provide traffic noise attenuation, also counts as an alteration of the alignment. There are some limited locations under some alternatives where project-related displacement may warrant a traffic noise study. The impact assessments for those areas are presented in Chapter 6, Impact Assessment.

3.1.3 Construction Noise Criteria

Project construction would take place in the city of Seattle. The City has its own municipal noise ordinance that would be applicable to the project. Noise impacts are assessed using the City of Seattle noise ordinance, which has more stringent criteria than the FTA criteria.

The maximum permissible sound levels from construction activities are governed by the Seattle Municipal Code, where Section 25.08 specifies permissible sound limits within Seattle. Seattle Municipal Code 25.08.410 sets forth separate sound limits for residential, commercial, and industrial districts. These districts, defined in Seattle Municipal Code 25.08.100, are based on the zoning of the affected properties. While districts are based on zoning, the two are not equivalent. For example, Neighborhood Commercial-1 is a commercial zone, but is considered a residential district. Table 3-3 shows the exterior sound level limits applicable to each district.

Table 3-3. City of Seattle Exterior Sound Level Limits

District of Sound Source	Residential Receiving Districts Leq (Lmax) (in dBA)	Commercial Receiving Districts Leq (Lmax) (in dBA)	Industrial Receiving Districts Leq (Lmax) (in dBA)
Residential	55 (70)	57 (72)	60 (75)
Commercial	57 (72)	60 (75)	65 (80)
Industrial	60 (75)	65 (80)	70 (85)

Source: Seattle Municipal Code 25.08.410, Exterior Sound Level Limits.

Notes:

Measurement time is 1 minute for a constant sound source and 1 hour for a varying sound source.

During measurement intervals, maximum sound level (Lmax) may exceed Leq limits by no more than 15 dBA.

The exterior sound level limits shown in Table 3-3 may be modified under certain circumstances, as outlined in Seattle Municipal Code 25.08.420. These modifications are for certain times of the day, classification of receiving properties, and type of sound generated. These modifications to the exterior sound level limits include the following reductions:

- 10 dB at receiving properties within residential districts during the nighttime hours of 10 p.m. and 7 a.m. on weekdays, 10 p.m. and 9 a.m. on weekends, and 10 p.m. and 9 a.m. on legal holidays
- 5 dB for sources that carry a pure tone component
- 5 dB for impulsive sources not measured with an impulse sound level meter

These reductions are cumulative and independent of one another. Therefore, the permissible nighttime exterior sound level in a residential district from an impulsive, tonal source would be 20 dB less than the exterior sound level described in Table 3-3.

Modifications to the permissible exterior sound level limits shown in Table 3-3 are allowed for construction activities. Daytime, non-impact construction activities are subject to Seattle Municipal Code 25.08.425. For public projects such as Sound Transit projects, modifications are permitted to the exterior sound level limits in all zones between 7 a.m. and 10 p.m. on weekdays and between 9 a.m. and 10 p.m. on weekends and legal holidays. The modifications allowed under Seattle Municipal Code 25.08.425 include the following increases during daytime hours:

- 25-dB increase for equipment on construction sites, including but not limited to crawlers, tractors, dozers, rotary drills and augers, loaders, power shovels, cranes, derricks, graders, off-highway trucks, ditchers, trenchers, compactors, compressors, and pneumatic-powered equipment
- 20-dB increase for portable powered equipment used in temporary locations in support of construction activities in any zone, maintenance activities on commercial property, or used in maintenance of public facilities, including but not limited to chainsaws, log chippers, lawn and garden maintenance equipment, and powered hand tools

- 15-dB increase for powered equipment used in temporary or periodic maintenance or repair of the grounds and appurtenances of residential property, including but not limited to lawnmowers, powered hand tools, snow-removal equipment, and composters

The resulting exterior sound level limits from construction activities are measured at the adjacent property line or 50 feet from the equipment generating the sound, whichever is greater. The resulting daytime construction sound limits are listed in Table 3-4.

Table 3-4. City of Seattle Exterior Daytime Construction Sound Level Limits

District of Sound Source	Residential Receiving Districts Leq (Lmax) (in dBA)	Commercial Receiving Districts Leq (Lmax) (in dBA)	Industrial Receiving Districts Leq (Lmax) (in dBA)
Residential	80 (95)	82 (97)	85 (100)
Commercial	82 (97)	85 (100)	90 (105)
Industrial	85 (100)	90 (105)	95 (110)

Source: Seattle Municipal Code 25.08.410 and Seattle Municipal Code 25.08.425.

Notes:

Measurement time is 1 minute for a constant sound source and 1 hour for a varying sound source.

During measurement intervals Lmax may exceed Leq limits by no more than 15 dBA.

Seattle Municipal Code 25.08.425 also includes modifications to the permissible exterior sound level limits for impact types of construction equipment, including equipment that create impulse sound or impact sound, or are used as impact equipment. Examples of this type of equipment are pavement breakers, pile drivers, jackhammers, and sandblasting tools. Impact construction equipment can exceed the exterior sound level limits in any 1-hour period between 8 a.m. and 5 p.m. on weekdays and 9 a.m. and 5 p.m. on weekends and legal holidays. However, sound levels associated with impact construction equipment are not allowed to exceed the values set forth in Table 3-5. These values are defined at the adjacent property line or 50 feet from the equipment, whichever is greater.

Table 3-5. City of Seattle Daytime Impact Construction Sound Level Limits

Activity During 1-Hour Period	Leq (dBA)
Continuous	90
30 minutes	93
15 minutes	96
7.5 minutes	99

Source: Seattle Municipal Code 25.08.425.

Note: Standard of measurement is a 1-hour Leq. Leq may be measured for times not less than 1 minute to project an hourly Leq.

In addition to providing modifications for exterior sound levels during construction, Seattle Municipal Code 25.08.425 also defines permissible limits for sound levels measured inside a commercial building adjacent to construction activities. Specifically, construction or maintenance equipment that exceeds the exterior sound level limits outlined in Table 3-4 when measured from the interior of buildings in a commercial district is prohibited between the hours of 8 a.m. and 5 p.m. Seattle Municipal Code 25.08.425 states that “interior sound levels shall be measured only after every reasonable effort, including but not limited to closing windows and doors, is taken to reduce the impact of the exterior construction noise.”

Typically, noise reduction due to the barrier effect of the building (e.g., noise reduction from the exterior to interior of a building assuming all doors and windows are closed) is approximately 25 dB. This is equivalent to the code modification allowed for construction noise (25 dB). Those interior limits are usually satisfied when work complies with daytime exterior construction noise limits and is farther than 50 feet from a commercial building.

3.2 Vibration Criteria

Rail transit can result in vibration that results in perceptible building vibration, rattle noises, and reradiated noise (groundborne noise). Vibration caused by light rail operations is typically well below what would cause even minor cosmetic damage to buildings. Therefore, the criteria for building vibration caused by transit operations are primarily concerned with potential annoyance of building occupants. Vibration caused by construction equipment and activities is typically evaluated for potential damage to nearby buildings rather than annoyance because it is temporary.

3.2.1 Transit Vibration Criteria

The FTA vibration impact criteria are based on the maximum indoor vibration level as a train passes. There are no impact criteria for outdoor spaces such as parks. The FTA vibration thresholds do not specifically account for existing vibration because it is very rare that even substantial volumes of vehicular traffic including trucks and buses would generate perceptible ground vibration unless there are irregularities in the roadway surface such as potholes or wide expansion joints. The FTA Guidance Manual (2018) recommends that where there are existing rail lines, existing vibration conditions should be considered when determining vibration impact criteria for a new transit project. For a discussion of locations where there are existing trains or transit vehicles in the corridor, refer to Section 5.3.1, Ambient Vibration Survey (Representative Sites).

Like noise, the sensitivity to vibration varies by land use type, and the criteria represent these sensitivities. Sensitive land use categories for vibration assessment are presented in Table 3-6 in order of sensitivity.

Table 3-6. Land Use Categories for Vibration Assessment

Land Use Category	Land Use Type	Description of Land Use Category
Not applicable	Special Buildings	This category includes special-use facilities that are very sensitive to vibration and groundborne noise that are not included in the categories below and require special consideration. Examples of these facilities include concert halls, television and recording studios, and theaters.
1	High Sensitivity	This category includes buildings where vibration levels, including those below the threshold of human annoyance, would interfere with operations within the building. Examples include buildings where vibration-sensitive research and manufacturing equipment is conducted, hospitals with vibration-sensitive equipment, and universities conducting physical research operations. The building's degree of sensitivity to vibration is dependent on the specific equipment that will be affected by the vibration.
2	Residential	This category includes all residential land use and buildings where people normally sleep, such as hotels and hospitals. Transit-generated groundborne vibration and noise from subways or surface running trains are considered to have a similar effect on receivers.
3	Institutional	This category includes institutions and offices that have vibration-sensitive equipment and have potential for activity interference such as schools, places of worship, and doctors' offices. Commercial or industrial locations including office buildings are not included in this category unless there is vibration-sensitive activity or equipment within the building. As with noise, the use of the building determines the vibration sensitivity.

Source: FTA 2018.

The FTA Guidance Manual (2018) provides two sets of criteria: one based on the overall vibration velocity level for use in a general vibration impact assessment and one based on the maximum vibration level in any 1/3-octave band (the band maximum level) for use with a detailed vibration assessment. This analysis applied the detailed vibration assessment criteria. The thresholds for use with the detailed vibration assessments are shown on Figure 3-1 and Table 3-7. For the detailed assessment, the predicted vibration levels in terms of the 1/3-octave band spectra are compared to the curves shown on Figure 3-1 to determine whether there is impact and the frequency range over which vibration mitigation should be evaluated. If the predicted vibration levels are below the curves on Figure 3-1 over the entire spectra, no impact is predicted.

Table 3-7 gives a description of the land uses that correspond to each of the vibration criteria (V.C.) curves on Figure 3-1, which are designated V.C.-A through V.C.-E. The curves apply to vibration-sensitive equipment, such as microscopes or magnetic resonance imaging machines. The Residential (Day) curve is applied to institutional land uses (Category 3) such as places of worship and schools, and the Residential (Night) curve is applied to residential land uses (Category 2).

Table 3-7. Interpretation of FTA Vibration Criteria for Detailed Analysis

Criterion Curve	Maximum Vibration Velocity (VdB) [a]	Description of Use
Workshop	90	Distinctly detectable vibration; appropriate to workshops and non-sensitive areas
Office	84	Detectable vibration; appropriate to offices and non-sensitive areas
Residential day	78	Barely detectable vibration; adequate for computer equipment and low-power optical microscopes (up to 20 times power)
Residential night, operating rooms and sensitive hospital equipment	72	Vibration not detectable, but groundborne noise might be audible inside quiet rooms; suitable for medium-power optical microscopes (100 times power) and other equipment of low sensitivity
V.C.-A	66	Adequate for medium- to high-power optical microscopes (400 times power), microbalances, optical balances, and similar specialized equipment
V.C.-B	60	Adequate for high-power optical microscopes (1,000 times power) and inspection and lithography equipment up to 3 micron-line widths
V.C.-C	54	Appropriate for most lithography and inspection equipment to 1-micron detail size
V.C.-D	48	Suitable in most instances for the most demanding equipment, including electron microscopes operating to the limits of their capability
V.C.-E	42	The most demanding criterion for extremely vibration-sensitive equipment

Source: FTA 2018.

[a] As measured in 1/3-octave bands of frequency over the frequency range of 8 to 80 hertz.

Figure 3-1. FTA Criteria for Detailed Vibration Assessment

Source: FTA 2018.

3.2.2 Groundborne Noise Criteria

Some buildings, such as concert halls, recording studios, and theaters, can be particularly sensitive to groundborne noise. Because of their sensitivity, these buildings usually warrant special attention during the impact assessment. Table 3-8 gives criteria for acceptable levels of groundborne vibration and groundborne noise for various types of special buildings.

Table 3-8. Groundborne Vibration and Noise Impact Criteria for Special Buildings

Type of Building or Room [a]	Groundborne Vibration Impact Levels for Frequent Events (VdB) [b]	Groundborne Noise Impact Levels for Frequent Events (dBA) [b]
Concert Halls	65 VdB	25 dBA
Television Studios	65 VdB	25 dBA
Recording Studios	65 VdB	25 dBA
Auditoriums	72 VdB	30 dBA
Theaters	72 VdB	35 dBA

Source: FTA 2018.

[a] If the building will rarely be occupied when trains are operating, then there is no need to consider impact. As an example, consider locating a commuter rail line next to a concert hall; if no commuter trains will operate after 7 p.m., then trains would rarely interfere with the use of the hall.

[b] "Frequent events" are defined as more than 70 vibration events per day; most transit projects fall into this category.

Table 3-9 presents the groundborne noise impact criteria for three different land use types. Category 1 land uses are buildings where low ambient vibrations are essential for interior operations, such as laboratories. These spaces are generally not sensitive to groundborne noise and therefore no groundborne noise criteria is applicable to these spaces. Limits for spaces particularly sensitive to groundborne noise are covered in Table 3-8.

Table 3-9. Groundborne Noise Impact Criteria for Frequent Events

Land Use Category	Groundborne Noise Impact for Frequent Events (decibels re 20 micropascals) [a]
Category 1: Buildings where low ambient vibration is essential for interior operations	Not applicable [b]
Category 2: Residences and buildings where people normally sleep	35 dBA
Category 3: Institutional land uses with primarily daytime use	40 dBA

Source: FTA 2018.

[a] "Frequent events" are defined as more than 70 vibration events of the same source per day; most rapid transit projects fall into this category.

[b] Vibration-sensitive equipment is generally not sensitive to groundborne noise.

3.2.3 Construction Vibration Criteria

Construction vibration was assessed for both potential damage to structures and human annoyance. For potential vibration effects during construction, the FTA's recommended criteria on vibration levels is applied because there are no state, county, or municipal vibration regulations. The parameter normally used to assess potential construction vibration effects to structures is peak particle velocity, which is the maximum velocity recorded during a particular event, such as from a jackhammer. The FTA's recommended limits for construction vibration for four building categories are as follows:

- Reinforced concrete, steel, or timber: 0.5 inch per second peak particle velocity
- Engineered concrete and masonry: 0.3 inch per second peak particle velocity
- Nonengineered timber and masonry buildings: 0.2 inch per second peak particle velocity
- Buildings extremely susceptible to vibration damage: 0.12 inch per second peak particle velocity

Annoyance from groundborne noise and vibration is generally not assessed for construction activities because they are short-term in duration. However, potential interference with sensitive activities at Category 1 or Special Building land uses from groundborne noise and vibration due to construction are evaluated applying the criteria for operations in Tables 3-8 and 3-9. At Category 1 and Special Building land uses, groundborne noise and vibration from even short-term construction activities may interfere with sensitive research processes or planned performance or recording events that would disrupt the normal operations at those facilities. Potential annoyance at Category 2 (residential) and Category 3 (institutional) land uses were evaluated for reference using the operational criteria but were not used to identify potential construction vibration impacts. The exception is groundborne noise and vibration from tunnel muck and support trains, which are evaluated to meet the FTA criteria for operations based on annoyance because the tunnel support trains may run continuously over several years.

This page is intentionally left blank.

4 NOISE AND VIBRATION IMPACT ANALYSIS ASSUMPTIONS AND METHODS

This section summarizes the assumptions and methods used for the noise and vibration analysis. In order to evaluate noise and vibration resulting from a transit project, identifying and characterizing the various project elements that could generate or potentially affect noise or vibration levels is essential. Key elements and sources pertaining to noise and vibration levels for the project are described in the following sections.

4.1 Noise Assumptions and Methods

This section summarizes the approach used to identify and characterize noise sources and predict future noise levels for potential sources of community impacts related to the West Seattle Link Extension. Project elements potentially influencing noise include light rail operation, track types and configuration, changes in traffic related to the project, and construction activities. Noise impacts from the operation and construction of the Build Alternatives were determined through noise and vibration modeling using FTA methods.

4.1.1 Operational Noise Elements

The plan and profile of the new light rail alignment, including the locations of special track work such as crossovers, and typical speeds were provided by the project design engineers. The plan and profile drawings used are included in Appendix J, Conceptual Design Drawings, of the West Seattle Link Extension Final EIS. The design information provided includes the elevation of the guideway, type of track (ballast-and-tie, embedded, and direct-fixation) and the location and design of the station alternatives.

4.1.1.1 Light Rail Operational and Maintenance Measures

This section describes the assessment approach for noise related to operating the light rail system. This includes noise from light rail operations, ancillary facilities, and wheel squeal. Sound Transit employs several operational measures to maintain low noise and vibration levels for its light rail trains. Table 4-1 lists operational and maintenance measures that Sound Transit performs on a regular basis and the benefit that each measure provides.

Table 4-1. System-wide Light Rail Operational and Maintenance Measures

Operational Measure	System Benefit
Rail grinding, maintenance, and replacement	As rails wear, both noise and vibration levels from light rail operations can increase. By grinding or replacing worn rails or correcting improper track alignment, noise and vibration levels will remain at the projected levels.
Wheel truing and replacement	Wheel truing is a method of grinding down flat spots (commonly called wheel flats) on the vehicle wheels. Flat spots occur primarily because of hard braking. When flat spots occur, they can cause increases in both the noise and vibration levels produced by the light rail vehicles.
Vehicle maintenance	Vehicle maintenance includes performing scheduled and general maintenance on items such as air conditioning units, bearings, wheel skirts, and other mechanical units on the light rail vehicles. Keeping the mechanical systems on the light rail vehicles in top condition will also help to maintain the projected levels of noise and vibration.
Operator training	Operators will be trained to operate light rail vehicles at the speeds given in the operation plan that was used for the analysis and to avoid hard braking, which can cause wheel flats and may also damage the track. Furthermore, by training operators to identify potential wheel flats and other mechanical problems with the light rail trains, proper maintenance can be performed in a timely manner.

4.1.1.2 Reference Light Rail Noise Levels

Sound Transit modeled noise from light rail operations using the methods described in the FTA Guidance Manual (FTA 2018). Input to the model included measured reference noise levels for the new light rail vehicles that are currently being used on the existing Link light rail system. Reference measurements for light rail operations were taken from the *2019 Reference Noise and Vibration Levels for Link Light Rail Projects* (Sound Transit 2019). The measured reference noise levels include measured levels in 5-mile-per-hour increments for ballast-and-tie track, direct-fixation track, and embedded track.

The speeds used in this analysis are the track design speeds. The light rail speed is limited by speed limited curves and reduced speed when accessing at stations. The speeds used in the analysis may be higher than actual speeds and assure a conservative noise impact analysis. More detailed information on how all this information is used to predict operational noise levels are provided in Section 4.1.2, Operational Noise Prediction Methods.

4.1.1.3 Crossovers and Special Track Work

Track crossovers are mechanical devices that enable light rail cars to be guided from one track to another at a junction point. Crossovers have a gap in the rails that is necessary for the flange of the light rail wheels to pass through at the location where the two tracks cross. As a wheel passes through the gap, there are increased noise and vibration levels. A frog is a rail-crossing structure that allows the train to cross over to another track or continue moving on the same track. A gap is provided on top of the frog so that vehicle wheels can pass regardless of which track is in use. According to the FTA Guidance Manual and measurements of the Link light rail system, standard frogs can increase noise levels by as much as 5 to 10 dB.

4.1.1.4 Light Rail Warning Bells

Consistent with Sound Transit operating rules, train-mounted bells would be sounded twice as a train enters a station and twice when the train leaves the station. The bells produce a maximum noise level of 80 dBA at 50 feet between 6 a.m. and 10 p.m. and are reduced to 72 dBA Lmax between 10 p.m. and 6 a.m. Sound Transit measured and validated train-mounted bells on light rail cars in October 2009, with several supplemental measurements in 2011 and 2012.

4.1.1.5 Operations Plan

The operations plan for this analysis reflects a future build-out of the regional light rail system established by the Sound Transit 3 Plan (Sound Transit 2016). This assumes light rail service is operating to north to Everett, south to Tacoma, and east to Downtown Redmond. Under this maximized future operational plan, the light rail trains would operate with four passenger cars during all periods of service.

Train frequencies are established based on ridership demand and other service standards. Table 4-2 shows the new service schedule for weekdays. Weekend and holiday service levels are based on early and late service levels, as shown in the table.

Table 4-2. Weekday Service Periods for Year 2042

Service Period	Time Period	Service Level	Train Frequency (minutes)
Early morning	5 a.m. to 6 a.m.	Early	10
Morning peak	6 a.m. to 8:30 a.m.	Peak	6
Midday	8:30 a.m. to 3 p.m.	Base	10
Afternoon peak	3 p.m. to 6:30 p.m.	Peak	6
Evening	6:30 p.m. to 10 p.m.	Base	10
Late Evening	10 p.m. to 1 a.m.	Late	15

Vehicle, track, and systems maintenance occurs between approximately 1 a.m. and 5 a.m. daily, outside of normal hours of light rail service. Based on preliminary operating plans, approximately two trains may be deployed between 4:30 and 5 a.m. to stage trains for the beginning of morning service at project stations. Similarly, about two trains may operate between approximately 1 and 1:30 a.m. along the West Seattle Link Extension as they return to the operations and maintenance facilities at the close of service each day.

4.1.1.6 Wheel Squeal and Wheel-flanging Noise

Wheel squeal is caused by the oscillation of the wheel against the rail on curved sections of rail. Sound Transit measured wheel squeal noise levels at several different locations along the Link light rail corridor and used these measurements as reference data. Based on these measurements, curves with radii of less than 600 feet and potentially up to 1,250 feet can produce maximum wheel squeal noise levels of 80 dBA to 90 dBA at 50 feet.

Research into methods of reducing wheel squeal noise, including using non-oil-based lubricants (such as water) and friction modifiers, has found such methods effectively reduce or eliminate wheel squeal. The lubricants can be applied by personnel working trackside or by an automated applicator. As provided in the Sound Transit *Design Criteria Manual, Revision 5* (Sound Transit 2021), potential for wheel squeal shall be identified. Locations where tight-radius curves of 600 feet or less are near noise-sensitive receivers shall include wheel squeal mitigation measures in the project design. In addition, provisions for wayside lubrication shall be incorporated in the project design at all curves up to a 1,250-foot radius near commercial or residential areas. If audible wheel squeal or flanging noise are present on curve radii of 601 feet to 1,250 feet during pre-revenue service, then mitigation such as wayside lubrication shall be applied to the rail gauge face and wheel flange. Because the noise level from wheel squeal varies greatly depending on curve radius, train speed, and track type, modeling of squeal is not normally performed. However, all curves with radii up to 1,250 feet are identified in the impact analysis in Chapter 6, Impact Assessment.

4.1.1.7 Light Rail Track Types

The track installation method can have an effect on noise levels emitted from light rail operations. First, all tracks on the Link light rail systems are continuously welded. Unlike freight rail tracks, which are butted, leaving a gap between tow rails that can increase noise and vibration levels, Sound Transit's welded rails provide a continuous smooth surface, reducing noise and vibration and improving the ride quality for patrons.

The overall track installation is generally performed using one of three methods: ballasted track, direct-fixation track or embedded track. Ballasted track is similar to freight rail tracks, with the track installed on concrete ties that are installed on top of the ballast, a crushed rock surface. Ballasted track is used mainly for at-grade guideways, and the ballast can absorb some of the noise making this the quietest of the three track installation methods. Direct-fixation track is guideway where the rails are installed with fasteners directly on a concrete plinth. This is also the method used on most all elevated structures and in tunnels. Due to the hard-reflective plinth surface, this method of track installation can increase the overall noise from the system by up to 3 dB for at-grade systems and 4 dB for elevated systems. The added noise from the elevated system is due, in part, to noise radiating directly from the structure.

The final type, embedded track, is usually a type of direct-fixation track embedded in a concrete slab or paved over to allow motor vehicles to drive over the tracks. This installation method is reserved for at-grade tracks with vehicles overcrossing. The only locations with embedded track in the project area are at access points for hi-rail vehicles, the service trucks that can operate along the guideway for servicing. Table 4-3 summarizes the different track types and corrections used for the project noise analysis.

Table 4-3. Light Rail Track-type Adjustments

Track Type	Adjustment in Decibels
At-grade ballast-and-tie track (ballast exposed)	0
Elevated structure	+4
Embedded track or retained-fill guideway	+3

Source: FTA 2018.

In some cases, the trackway would be installed in a retained cut, where the trackway is cut into the side of a hill; an example of this is along Pigeon Point in the Duwamish Segment. In these cases, the topographical conditions are included in the analysis and can provide shielding of noise from light rail operations. The level of shielding is calculated based on the relationship between the trackway and the noise-sensitive property. Depending on the depth of the cut and locations of sensitive properties, noise reductions of 0 to 10 dB or more are possible.

4.1.2 Operational Noise Prediction Methods

Noise impacts that would result from the project were determined through the following approach:

- Sound Transit performed a land use survey of potential noise-sensitive receivers near the new light rail alignments. This process involved site visits and use of land use maps and information.
- Sound Transit conducted long-term (multi-day) and short-term (15- to 30-minute) noise monitoring to establish existing noise levels for the potentially affected area. Ambient noise monitoring was taken at 42 locations along the project corridor. The criteria for selecting the monitoring locations included location of potential alignments, land use, existing ambient noise, number of sensitive receivers in the area, and level of expected impact.
- Field noise measurements were used to develop a set of existing ambient sound levels for the noise-sensitive receivers.
- The existing ambient sound levels were also used to determine the noise impact criteria. The FTA criteria for noise impacts are based on the existing noise level and land use.

- Projections of light rail noise levels were made based on track type, train speed, number of passenger cars, and distance of receiver from tracks, with adjustments for shielding and ground attenuation. Adjustments for track crossovers are discussed in Section 4.1.1.3, Crossovers and Special Track Work. Mitigation adjustments based on track type are provided in Section 7.1, Operational Noise Mitigation. Typical noise reductions for sound walls, elevated acoustical walls, and trench situations are shown in Section 7.1. Sound attenuation related to physical shielding from the elevated structure and other existing and planned structures was included in the analysis using acoustical formulas from the FTA Guidance Manual (FTA 2018). Noise related to bells at stations was included in the analysis as described in Section 4.1.1.4, Light Rail Warning Bells.
- Sound Transit evaluated noise projections with respect to the FTA impact thresholds to determine whether a receiver would be affected by light rail operations. Where noise impacts were identified, mitigation recommendations follow Sound Transit's Light Rail Noise and Vibration Mitigation Policy (Sound Transit 2023).
- Measured noise-level reductions from existing noise barriers installed on the elevated guideway and at-grade track along the existing Link Light Rail System and information from the FTA Guidance Manual (2018) were used to assist in the final mitigation predictions.

4.1.3 Traffic Noise Prediction Methods

The potential to create or increase exposure to traffic noise as a result of the transit project must also be considered. As defined in Federal Highway Administration noise abatement policy (2010), changes in the traffic noise environment could occur if the project creates new roadways or alters existing roadways in relation to noise-sensitive properties or changes the pathway for traffic noise by removing or altering barriers (buildings, berms, or walls) that currently provide some level of shielding from traffic noise. These locations are identified and evaluated for potential traffic noise impacts based on existing noise measurements and Federal Highway Administration impact criteria.

4.1.4 Construction Noise Prediction Methods

Potential impacts from construction noise were evaluated using representative sound levels from various types of construction equipment provided in the FTA Guidance Manual (2018). Construction sound levels were generally predicted using the methodology detailed in Section 7 of the FTA Guidance Manual (2018), which analyzes the two loudest pieces of equipment expected for a particular construction activity. Resulting sound levels were compared to codified sound limits within the city of Seattle.

The analysis predicted sound levels from activities expected to produce the highest sound levels, require several months to complete, or require work during nighttime hours. These construction activities include elevated light rail construction, retained-cut construction, tunneling, cut-and-cover station construction, and bridge construction over water crossings.

For Category 1 land uses, computer noise models were used to predict sound levels from construction. Noise models were made using the 3-D computer noise modeling software environment, CadnaA. The CadnaA models use the International Organization for Standardization 9613 Part II algorithms, which account for the effects of distance, topography, and surface reflections on sound levels. Due to variations in sound levels created by construction equipment and the locations of construction equipment, actual sound levels at nearby properties may vary for any specific construction activity.

4.2 Vibration Assumptions and Methods

Both the construction and operation of a light rail system generate vibration that is transmitted through the ground and into nearby buildings. It is rare for the vibration from train operations to be high enough to create a risk of structural damage to buildings. However, it is possible for construction vibration to approach risk thresholds for minor cosmetic damage. Construction and light rail operations both have the potential to generate vibration that may be intrusive to building occupants. The following vibration sources are associated with light rail systems:

- Train operations: Light rail operations can create groundborne vibration that can be intrusive to occupants of buildings close to the tracks. However, light rail operation vibration levels in general are well below the thresholds used to protect sensitive and fragile structures from damage. A key assumption in the vibration predictions is that optimal wheel and rail profiles would be maintained for the system through periodic truing of the wheels and rail grinding.
- Special track work: The wheel impacts at the frogs used at special track work for turnouts and switches increases vibration levels. A frog is a rail-crossing structure at track crossovers that allows the train to cross over to another track or continue moving on the same track.

4.2.1 Operational Vibration Prediction Methods

To predict groundborne vibration associated with the West Seattle Link Extension, the detailed vibration assessment procedure outlined in the FTA Guidance Manual (2018) was followed. This is an empirical model based on testing the vibration propagation characteristics of the soil in the project corridor and measurements of the vibration characteristics of existing Sound Transit light rail vehicles. As is discussed in Section 5.3.2, Vibration Propagation Tests, vibration propagation measurements were performed at surface and below-grade locations throughout the new project corridors.

The result of the vibration propagation tests is the line source transfer mobility, a measure of how efficiently vibration propagates through the soil. The force density level quantifies the vibration forces generated by the train and track. The basic relationship used for the vibration predictions is:

$$Lv = \text{Force Density Level} + \text{Line Source Transfer Mobility} + \text{Safety Factor}$$

Where: Lv is the train vibration velocity measured at the ground surface. Force density level is derived by measuring Lv and line source transfer mobility at a site where there are existing light rail vehicle operations. The force density levels used in this analysis are the measured force density level values of the existing Sound Transit Link light rail system (Rajaram 2019). The force density levels depend on speed and track type. The force density levels are available for speeds in increments of 5 miles per hour from 25 miles per hour to 55 miles per hour for ballast-and-tie and direct-fixation track structures. The force density level for the two track structure types at 55 miles per hour is shown on Figure 4-1. The force density levels include a 3-dB safety factor.

Elevated structures typically reduce vibration by about 10 dB relative to at-grade track. For this assessment, an adjustment of -10 dB was applied at all 1/3-octave band center frequencies except at 10 hertz and 12 hertz, as shown on Figure 4-2. This adjustment is based on force density level measurements of a Link aerial structure (Rajaram and Wolf 2014).

Figure 4-1. Force Density Levels at 55 Miles per Hour for Direct-Fixation and Ballast-and-Tie Track Structures

Figure 4-2. Vibration Reduction from Elevated Track Structure

The line source transfer mobility measurement sites and results are discussed in Section 5.3, Vibration Measurements. The data were collected at surface sites in areas where elevated or at-grade track is proposed and at below-grade or borehole sites where tunnels are proposed. The approach used for predicting vibration from light rail operations was to average the line source transfer mobilities measured throughout the project study area. Separate averages were developed for the surface sites and borehole sites. The line source transfer mobility results showed similar trends at sites throughout the project study area, indicating the average is a reasonable approximation to use in the prediction model. For Category 1 sensitive receivers where site-specific line source transfer mobility data were collected, the site-specific data were applied as opposed to the averaged data. Figures 4-3 to 4-6 show the line source transfer mobility curves for the surface and borehole data at 25 feet, 50 feet, 100 feet, and 200 feet, respectively. The borehole data are only shown at 100 feet and 200 feet because the data were usually collected at depths of 80 feet or greater.

The line source transfer mobility data were applied to sensitive receivers throughout the study area as follows:

- Surface West Seattle: Applied to sensitive receivers near elevated, at-grade, or retained-cut track in the West Seattle Junction, Delridge, or Duwamish segments.
- Borehole West Seattle: Applied to sensitive receivers near tunnel track in the West Seattle Junction, Delridge, or Duwamish segments.

Figure 4-3. Average Line Source Transfer Mobility at 25 Feet for Surface Measurement Sites

Figure 4-4. Average Line Source Transfer Mobility at 50 Feet for Surface Measurement Sites

Figure 4-5. Average Line Source Transfer Mobilities at 100 Feet for Surface and Borehole Measurement Sites

Figure 4-6. Average Line Source Transfer Mobilities at 200 Feet for Surface and Borehole Measurement Sites

The prediction model includes a safety factor of +3 dB to each 1/3-octave band to account for uncertainties in the line source transfer mobility and potential uncaptured amplification effects inside buildings. When vibration is propagated from the ground to the building foundation there is loss in vibration energy at the buildings' interface with the ground, which is commonly referred to as coupling loss. Floor amplification may occur due to resonances of the floors and varies greatly, depending on the type of construction. For the combined effect of coupling loss and floor amplification, the FTA Guidance Manual (2018) recommends a net adjustment of +1 dB for the vibration inside a typical residence. A Transit Cooperative Research Program study based on 35 outdoor-indoor vibration measurements in several cities in North America showed an average outdoor-indoor amplification of 0 dB with a standard deviation of approximately 5 dB (Zapfe et al. 2009, McKenna 2011).

With the exception of Category 1 buildings with building-specific measurement data, it was assumed that the coupling loss and building amplification was a net 0-dB effect. The safety factor of +3 dB is a conservative approach that ensures that in the majority of cases the predicted vibration levels are higher than what would occur when the new project is operational. For Category 1 buildings with site-specific measurements, a measured building adjustment was applied to the predicted level. The measured building adjustments for those Category 1 buildings are presented in Attachment N.3H, Vibration Analysis of Category 1 Uses and Special Buildings.

Another source of vibration accounted for in the prediction model is special trackwork. The wheel impacts at the gaps in the rail at special trackwork for turnouts and switches increases vibration levels. The prediction model for this assessment applies the special trackwork adjustment recommended in the FTA Guidance Manual (2018): Wheel impacts are assumed to cause a localized increase in vibration of 10 VdB up to a distance of 100 feet and an increase in vibration of 5 VdB from 100 to 200 feet.

Track curvature can increase vibration levels. The prediction model assumes an increase in force density level (Ccurv) for tracks with curve radius less than 6,000 feet using the following formula:

$$\text{Ccurv (decibel)} = 3280 \text{ feet/radius (feet)}$$

The force density level adjustment for curves with radius less than 1,150 feet is limited to +3 dB.

Groundborne noise refers to the noise generated by groundborne vibration. The relationship between the predicted groundborne vibration, Lv, and the predicted groundborne noise is equal to the vibration velocity plus the A-weighting adjustment at the 1/3-octave band center frequency plus an adjustment to account for the conversion from vibration velocity level to sound pressure level (Krad), such as any acoustical absorption in the room. The FTA Guidance Manual (2018) recommends a Krad value of -5 for typical residential rooms. This analysis assumes a Krad value of -5 decibels for all sensitive receivers.

4.2.2 Construction Vibration Prediction Methods

Vibration associated with construction of the West Seattle Link Extension generally falls into two categories: tunneling operations and surface construction activities. Several different alignment alternatives are under consideration and detailed means and methods of construction have not been determined. Therefore, the construction vibration analysis focuses on determining the minimum distance between sensitive receivers and major vibration-generating equipment pieces that would exceed the construction vibration criteria. An analysis specific to Category 1 land uses in the study area has also been conducted to determine the potential for interference with sensitive activities at those facilities.

4.2.2.1 Tunneling Construction Vibration

Many areas of the alignments under consideration include tunnels constructed by an earth pressure balance tunnel boring machine. The machine removes soil and rock via a rotating cutterhead at the front, followed by hydraulic thrust jacks that are temporarily extended to hold the tunnel wall in place. Each time the cutterhead advances 5 feet, the thrust jacks are retracted and replaced with concrete tunnel liner segments. The liner segments are delivered from the tunnel supply shaft to the tunnel boring machine via a temporary rail system, positioned on the tunnel wall by a vacuum erector and bolted into place with handheld pneumatic impact wrenches. The main sources of vibration during this process are tunnel boring machine cutterhead mining, thrust jack retraction during liner segment installation, and operation of the supply train for workers and materials. A vibration prediction model for these tunneling activities was developed using measured data from tunneling under the University of Washington main campus (Bergen and Schwarz 2015, Bergen et al. 2012).

Operation of the tunnel boring machine cutterhead can generate a large range of vibration levels that is affected by underground features such as cobbles as well as the type of surrounding soil being tunneled through. Measurements conducted during tunneling under the University of Washington main campus suggest that vibration levels from the tunnel boring machine cutterhead are generally higher in areas of sandy soils and lower in clay/silt soils. Reference levels for the tunnel boring machine cutterhead vibration analysis have been based on those measurements at the University of Washington and are shown on Figure 4-7. A range of values are included to account for the variability in the cutterhead vibration levels due to depth, soil type, and underground features like cobbles. The reference levels were measured at distances ranging from 0 feet to over 200 feet horizontally along the surface from the tunnel centerline, and the range of reference levels are considered valid for those distances.

Figure 4-7. Reference Vibration Levels for Tunnel Boring Machine Cutterhead Operation

Source: Bergen et al. 2012.

Vibration levels generated as the concrete liner segments are positioned and bolted into place are negligible, and usually below the existing ambient vibration levels at the surface. However, retraction of the hydraulic thrust jacks during the liner segment installation has the potential to generate high levels of vibration if it includes a hard stop, when the cylinders are retracted at full speed. Reference vibration levels of thrust jack retraction measured during the University of Washington tunnel construction are shown on Figure 4-8. The reference level range accounts for the variability in vibration levels due to the tunnel depth and nearby soil type and are considered valid for distances from 0 to 200 feet measured horizontally from the tunnel centerline.

The supply train may be used to transport workers and materials from the portal or tunnel supply shaft to the tunnel boring machine. A supply train typically travels at 12 miles per hour and consists of steel-wheeled flatbed trailers pulled by a diesel locomotive. The rail is progressively laid out in short sections as the boring machine travels along its path, and the rail often includes some level of damage on the running surface. Gaps of up to 3/4 inch between adjoining rail sections were noted during tunneling for the University Link project. Both the uneven rail running surface and the rail gaps contribute to higher vibration levels. Rail sections are installed either by using pre-assembled rail fastened to wooden ties, or by fastening the rail to temporary steel ties bolted directly to the tunnel invert.

Figure 4-8. Reference Vibration Levels for Thrust Jack Retraction

Source: Bergen et al. 2012.

Reference vibration levels for a supply train running at 12 miles per hour on uneven rail are shown on Figure 4-9 and are given as a range of values based on measurements conducted during the University of Washington tunnel construction. The range of values accounts for the variability in vibration levels due to the tunnel depth and nearby soil type and are considered valid for distances from 0 to 200 feet measured horizontally from the tunnel centerline.

As discussed in Section 2.2, Vibration Fundamentals and Descriptors, groundborne noise is a low-frequency rumble caused by room surfaces radiating sound waves as they vibrate. A groundborne noise assessment is not included in most construction assessments because the airborne noise generated by the construction is typically higher than the groundborne noise. However, because there is no airborne noise path during tunneling a groundborne noise assessment has been conducted for these activities. The impact assessment is presented in Section 6.4, Construction Vibration Impacts.

Figure 4-9. Reference Vibration Levels for Tunnel Boring Machine Supply Train (12 miles per hour with uneven rail)

Source: Bergen et al. 2012.

4.2.2.2 Surface Construction Vibration

Surface construction activities often include the use of high-vibration equipment pieces, the most common of which are listed in Section 6.4.2, Surface Construction Vibration Impacts. The reference vibration levels for the analysis come from the FTA Guidance Manual (2018) and are shown as peak particle velocity levels, which quantify the maximum vibration velocity from a piece of equipment at a distance of 25 feet. The damage criteria for buildings as discussed in Section 3.2.2, Groundborne Noise Criteria, is in terms of peak particle velocity. However, the criteria for sensitive equipment and occupant annoyance (Section 3.2.1, Transit Vibration Criteria) is in VdB, which are a root mean square of a vibration velocity signal. The ratio of the peak particle velocity to the max root mean square level is called the crest factor and is typically between 4 and 5. A crest factor of 4 has been used for this analysis. The equation below is used to convert from peak particle velocity (inches per second) to a vibration level L_v (VdB):

$$L_v = 20 \times \ log_{10}\left(\frac{peak\ particle\ velocity}{crest\ factor\ \times\ 10^{-6}}\right)$$

In most cases, construction equipment will not be operating at the 25-foot reference distance, so a distance correction is needed. The following equation is used to convert peak particle velocity reference values to a desired distance:

$$peak\ particle\ velocity_{equip} = peak\ particle\ velocity_{ref} \times \left({D_{ref}}/{D_{equip}}\right)^{1.5}$$

where D_{ref} is the reference distance (typically 25 feet) and D_{equip} is the distance between the equipment and the sensitive receiver. Typically, the minimum distance each piece of equipment is expected to operate from a sensitive receiver is determined and vibration predictions are made based on that distance using the equation above. The predictions are compared to the criteria to determine whether impacts are expected. This type of analysis is not possible at this stage because detailed information about construction means and methods and site layouts are not available. Instead, the equation above was used to determine the distance from a sensitive receiver at which each piece of equipment would generate vibration levels equal to the impact threshold. The result of this analysis is presented in Section 6.4.2.

This page is intentionally left blank.

5 AFFECTED ENVIRONMENT

Sound Transit identified noise- and vibration-sensitive locations throughout the project corridor and selected locations where noise monitoring and vibration testing would be performed. The study area for noise is based on measured noise levels of the existing fleet of Sound Transit light rail vehicles, operational schedule, and train speeds, and is large enough to capture all potential noise impacts from system operations. Based on this information, the analysis includes noise-sensitive properties within at least 500 feet of the track alignments.

The potential area of effect for the vibration study is smaller compared to noise because vibration levels attenuate more rapidly. The potential area of effect for the vibration study is 200 feet from the track alignment for most land uses, such as residences and schools, and 450 feet from the track alignment for more vibration-sensitive land uses such as research laboratories or recording studios.

The following sections describe the land uses along the West Seattle Link Extension corridor, the existing noise-level measurements, and the current noise sources in the corridor. A more detailed discussion of land use can be found in Section 4.2, Land Use, of the Final EIS. The land uses are summarized for their potential sensitivity to noise and vibration. Most identified sensitive land uses are sensitive to both noise and vibration. The exceptions include outdoor parks, which may be noise-sensitive depending on usage but are not vibration-sensitive, and vibration-sensitive equipment (such as a magnetic resonance imaging machine), which are not sensitive to airborne noise. The tunnel segments would not generate airborne noise during operations. As such, sensitive receivers near tunnel segments are only assessed for groundborne noise and vibration impacts and not airborne noise during operations.

5.1 Noise- and Vibration-sensitive Receivers

This section provides an overview of the noise- and vibration-sensitive receivers along the corridors being evaluated for the West Seattle Link Extension. Chapter 3, Noise and Vibration Impact Criteria, of this document defines the land use types considered as noise- and vibration-sensitive under the FTA assessment methodology (FTA 2018). For a more detailed presentation of land uses, refer to Section 4.2 of the Final EIS.

5.1.1 SODO Segment

No noise- or vibration-sensitive properties were identified in the SODO Segment. Land uses in this segment are predominantly industrial and commercial (Figure 5-1). Alternatives in this segment would be a mix of at-grade and elevated options.

The SODO Trail, a 1-mile urban bicycle and pedestrian trail, runs along the east side of the light rail line between South Royal Brougham Way and South Forest Street. Based on the land uses, there was no noise or vibration analysis required.

5.1.2 Duwamish Segment

Similar to the SODO Segment, the Duwamish Segment is predominantly industrial and commercial land uses that are generally not noise- or vibration-sensitive (Figure 5-2).

Noise-sensitive land uses include fire stations, single- and multi-family housing, schools, and a recording studio. The Secret Studio Records/Studio 1208 recording studio, located at 3856 23rd Avenue Southwest, is an FTA Category 1 noise-sensitive land use. The Seattle Fire Department has two fire stations in this segment that are considered noise-sensitive because they have sleeping quarters (FTA Category 2): Fire Station 14 at 3224 4th Avenue South, and Fire Station 36 at 3600 23rd Avenue Southwest. On the west side of the segment, there are single- and multi-family residences in the Pigeon Point and Riverside communities. Single- and multi-family housing, public and institutional uses (Pathfinder K-8 School), the Delridge Connector Trail (paved bicycling and walking trail), and open space (West Duwamish Greenbelt) are all in the Pigeon Point community. The only part of West Duwamish Greenbelt that is near the Link light rail alignments are along the steep hillside near Pigeon Point, which is south of the West Seattle Bridge, dominated by noise from traffic on the bridge, and not an area with public access; therefore, it is not considered noise-sensitive under FTA criteria.

Vibration-sensitive land uses also include fire stations, single- and multi-family housing, schools, a recording studio, and a precision machining facility. The Category 2 (residential) and Category 3 (institutional) vibration-sensitive land uses in the Duwamish Segment are the same as the described noise-sensitive land uses. The Harbor Island Machine Works at 3431 11th Avenue Southwest is a precision machining company and is the only Category 1 vibration-sensitive land use in the Duwamish Segment, while the Secret Studio Records/Studio 1208 recording studio at 3856 23rd Avenue Southwest is the only special-use building.

The Bootstrap Music Company, located in the industrial area near the east end of the West Seattle Bridge, provides music rehearsal space for rent but is not considered noise- or vibration-sensitive under FTA criteria because its use is compatible with higher noise and vibration levels. This area would have higher existing noise levels as there is freight train activity and frequent heavy truck traffic in close proximity to the building.

5.1.3 Delridge Segment

Noise-sensitive uses in the Delridge Segment include residential uses, schools and childcare centers, parks, and open spaces as described below.

Most of this segment is single or multi-family residential land uses (Figure 5-3). Several multi-family residential uses are concentrated along Southwest Avalon Way, north of Southwest Genesee Street. There is some non-noise-sensitive commercial development along Delridge Way Southwest. In addition to many residential uses, other noise-sensitive uses include Alki Beach Academy at 2414 Southwest Andover Street, Mode Music Studios at 3805 Delridge Way Southwest, and the Youngstown Cultural Arts Center at 4408 Delridge Way Southwest (FTA Category 3).

West Seattle Link Extension

Parks and active outdoor uses include the West Seattle Golf Course, Longfellow Creek Natural Area, and Delridge Playfield and Community Center; however, due to the locations and existing noise levels, only parts of the Longfellow Creek Natural Area were considered noise-sensitive under the FTA criteria. Noise-sensitive parts of the Longfellow Creek Natural Area include the portions of the park that have lower noise levels and are not near arterial roadways in the area, including Southwest Genesee Street. Locations selected for analysis at the Longfellow Creek Natural Area include the trail just north of Southwest Nevada Street and the area near the Dragonfly Garden and Pavilion.

A small portion of this segment is within the Duwamish Manufacturing/Industrial Center and includes Nucor Steel, a steel manufacturing plant, also not considered noise- or vibration-sensitive under FTA criteria.

In the Delridge Segment, the vibration-sensitive receivers are the same as the noise-sensitive receivers.

5.1.4 West Seattle Junction Segment

Noise- and vibration-sensitive properties in the West Seattle Junction Segment include a mix of single- and multi-family residences, childcare centers, a fire station, and places of worship as described in the following paragraphs (Figure 5-4).

This segment includes the West Seattle Junction hub urban village, where there is an active mixed-use district serving the surrounding single- and multi-family residential areas. Fire Station 32 is in this segment at 3715 Southwest Alaska Street and is considered noise-sensitive because it has sleeping quarters (FTA Category 2). Commercial and mixed-use development is mostly clustered along Fauntleroy Way Southwest, Southwest Alaska Street, and California Avenue Southwest and includes childcare centers such as Bright Horizons at 4530 38th Avenue Southwest and the West Seattle Family Y.M.C.A. at 3622 Southwest Snoqualmie Street. The West Seattle Stadium is also in this segment; however, active sports complexes, including the West Seattle Stadium, are not considered noise- or vibration-sensitive under FTA criteria. Two places of worship are also in this segment, the Eastridge Church at 4500 39th Avenue Southwest and the Calvary Chapel West Seattle at 4217 Southwest Oregon Street.

Sensitive receivers within the screening distance of the tunnel alternatives are assessed for groundborne noise and vibration impacts, but not for airborne noise.

5.2 Noise Measurements

Sound Transit characterized the existing noise environment through onsite inspections and onsite noise monitoring. Monitoring was performed at 42 locations, including 22 long-term (approximately 48-hour or more) and 20 short-term (30-minute) sites. Long-term monitoring was performed at locations representative of nearby residential use properties. Short-term monitoring was conducted near residences and nonresidential use properties, such as parks and schools. Sound Transit also collected traffic counts at several of the short-term noise monitoring locations to predict noise impacts from changes to roadways associated with project construction.

Noise monitoring locations were selected based on land use, existing noise sources, proximity to light rail alternatives and profile types, representative land uses, and access allowed by the property owner (when not in the public right-of-way). Long-term noise monitoring was primarily used to establish the existing 24-hour Ldn along the corridor. Where long-term monitoring was not practical, short-term monitoring was conducted to supplement nearby long-term monitoring sites, and to support the traffic noise analysis.

5.2.1 Measurement Methodology

Noise measurements were conducted in general accordance with the FTA Guidance Manual and the American National Standards Institute procedures for community noise measurements. Measurement locations were at least 5 feet from structures and 5 feet above the ground (where possible) to reduce the effects of acoustical reflections on the measurement results. Traffic counts accompanying the noise measurements were also taken in accordance with the Federal Highway Administration and WSDOT standards.

Equipment used for the noise monitoring included Brüel & Kjaer Type 2250, Svantek SV979, Svantek 958, Svantek SV971, and Svantek SV307 sound level meters. All sound monitoring equipment was calibrated before and after the measurements using acoustic calibrators. Measurement equipment was calibrated within 1 year of the measurement dates by an accredited testing laboratory traceable to the National Institute of Standards and Technology. All measurement equipment met or exceeded the requirements for an American National Standards Institute Type 1 noise measurement system.

Measurement periods that included rain or wet road conditions were excluded from the analysis. All Ldn values were calculated from a minimum of 48 hours of data.

Short-term measurements for most locations were made approximately twice per site, at least once in the morning between 7 a.m. and 10 a.m. and again in the afternoon between 3 p.m. and 7 p.m. The reported values from these measurements are the loudest overall Leq measured either in the morning or afternoon.

The following sections describe the existing noise environment in the West Seattle Link Extension. It should be noted that noise measurements were not taken in the SODO Segment because adjacent receivers did not warrant noise measurements. In addition, all noise measurements were taken during normal operations of the West Seattle Bridge, and none were taken during the COVID-19 travel restrictions.

Complete results of the monitoring, along with photos of the system installations and locations, are provided in Attachment N.3A, Noise Measurement Data, Site Details, and Photographs.

5.2.2 Existing Noise Measurement Results

The West Seattle Link Extension had 22 long-term and 20 short-term monitoring locations as shown on Figures 5-5 through 5-7. Sound levels in the project area are dominated by traffic noise on major arterial roadways, such as the West Seattle Bridge, Fauntleroy Way Southwest, West Marginal Way Southwest, and Delridge Way Southwest. Table 5-1 summarizes ambient noise monitoring for the West Seattle Link Extension, which includes the monitoring locations, addresses, land use, and type of measurements. Although the noise monitoring location numbers may not be shown in order, the monitoring sites are generally presented from east to west.

For the SODO Segment, there are no properties identified that are noise-sensitive under FTA criteria; therefore, no sound levels were measured in this segment.

5.2.2.1 SODO Segment

There are no sensitive receivers in the SODO Segment.

5.2.2.2 Duwamish Segment

Sound levels in the Duwamish Segment are governed almost entirely by traffic on the West Seattle Bridge and West Marginal Way Southwest, heavy truck traffic, heavy rail service, loading and unloading ships, and foghorns. The Ldn values in this segment ranged between 59 dBA and 75 dBA (M-20 to M-23 and ST-7) and peak hour Leq values ranged between 56 dBA and 72 dBA (M-20 to M-23 and ST-7 and ST-15 through ST-20). Median nighttime Leq levels ranged from 58 dBA to 67 dBA (M-20 to M-22).

5.2.2.3 Delridge Segment

The Delridge Segment Ldn values range between 53 dBA and 72 dBA (M-13 through M-27, M-30, and ST-3 to ST-14) and peak hour Leq values range between 47 dBA and 74 dBA (M-13 through M-27, M-30, and ST-3 to ST-14). Median nighttime Leq values ranged between 42 dBA and 54 dBA (M-13 through M-27 and M-30). Traffic on arterial roadways such as Delridge Way Southwest and Southwest Genesee Street were the dominant sound sources in this segment. Other contributing sound sources include smaller roadways, aircraft noise, industrial facilities, and trains.

5.2.2.4 West Seattle Junction Segment

The Ldn values in the West Seattle Junction Segment ranged from 55 dBA to 73 dBA (M-1 through M-12, M-28 through M-29, and ST-1 to ST-2) and peak hour Leq ranged from 53 dBA to 70 dBA (M-1 through M-12, M-28 through M-29, and ST-1 and ST-2). Median nighttime Leq values ranged from 48 dBA to 64 dBA (M-1 through M-12 and M-28 through M-29). Sound levels in this segment are primarily governed by traffic noise on nearby arterial roadways, such as Fauntleroy Way Southwest and 35th Avenue Southwest.

5.3 Vibration Measurements

The vibration measurements conducted for the assessment include an ambient vibration survey and vibration propagation measurements. The ambient vibration measurement survey documents existing vibration levels near existing rail lines and at highly vibration-sensitive buildings. The vibration propagation measurements are used to quantify how efficiently vibration travels through the soil and are used in the vibration prediction model. The vibration propagation measurements are completed at representative sites throughout the study area.

5.3.1 Ambient Vibration Survey (Representative Sites)

The FTA Guidance Manual (2018) recommends that where there are existing rail lines, existing vibration conditions be considered when determining vibration impact criteria for a new transit project. Both the existing vibration levels and the frequency with which the existing rail corridor is used are factors in determining the appropriate impact criteria.

There are existing freight operations in West Seattle, but they are infrequently used or beyond the screening distance of the vibration-sensitive receivers. An existing vibration measurement was completed at Harbor Island Machine Works, a Category 1 vibration-sensitive receiver. The

results of the ambient vibration measurement are shown in Attachment N.3H, Vibration Analysis of Category 1 Uses and Special Buildings.

5.3.2 Vibration Propagation Tests

A vibration propagation test is used to determine the line source transfer mobility, which is a measure of how efficiently vibration travels through the earth. The field test procedure for determining the line source transfer mobility is shown schematically on Figure 5-8 for at-grade or surface sites. The measurement consists of dropping a heavy weight on to the ground surface and measuring the force imparted into the ground and the vibration response at sensors at several distances from the weight.

As shown on Figure 5-8, the weight is dropped at a line of discrete impact points to approximate the distributed line source of a light rail vehicle. The accelerometer sensors that measure the vibration response are placed in a line perpendicular to the line of impact points. The number of accelerometers and their distances from the impact line vary at each test site depending on field conditions.

Figure 5-8. Schematic of Surface Vibration Propagation Test Procedure

For tunnel and borehole sites, an impact hammer was used to generate vibration at the bottom of a borehole. Typically, data were collected at three depths: 10 feet above the depth of the track, at the depth of the track, and 10 feet below the depth of the track. The measured data from the three test depths were extrapolated to account for the length of the train instead of using a line of impact points as with the surface measurements. The accelerometer sensors that measure the vibration response were placed on the surface in a line extending away from the borehole. At some measurement locations, sensors were also placed inside of the building to measure the building response. Figure 5-9 shows a schematic of the borehole vibration propagation test procedure.

Figure 5-9. Schematic of Borehole Vibration Propagation Test Procedure

The vibration propagation test sites were selected based on a review of aerial photographs and a windshield survey of land uses. Vibration propagation tests have been completed at seven sites in the project study area. The results of the vibration propagation test are the line source transfer mobility and the coherence. Coherence is a measure of the quality of the line source transfer mobility results and varies between 0 and 1. A coherence value close to 1 indicates that the vibration response and the force generated by the dropped weight are closely related. A coherence less than about 0.2 indicates a relatively weak relationship between the exciting force and the vibration response. Low coherence results may occur when the ambient vibration is relatively high, the distance between the dropped weight and the sensor are relatively far, or when the soil is a poor transmitter of vibration at a particular frequency. Most measurement sites have coherence below 0.2 at frequencies less than 20 hertz, indicating the soil is a relatively poor transmitter of vibration at low frequencies. Many measurement sites have low coherence for the farthest sensor locations.

Higher line source transfer mobility levels indicate that vibrations are transmitted more efficiently through the soil. The frequency range with the highest line source transfer mobility values is important because it indicates the frequency range where vibration is transmitted most efficiently. If the frequency range with high line source transfer mobility values coincides with the frequency range in which the train produces the most energy, it would result in higher vibration at sensitive receivers. In the project area, surface propagation tests were completed at four sites in residential areas and at the Category 1 sensitive receiver Harbor Island Machine Works. Borehole propagation tests were completed at two sites in residential areas. A summary of the vibration propagation test sites and sensor locations is provided in Table 5-2, and a map of the test sites is shown on Figures 5-5 through 5-7. Surface vibration propagation test sites are labeled with letters and borehole propagation test sites are labeled with numbers. Photographs and aerial maps of each test site are provided in Attachment N.3B. Detailed vibration propagation measurement results, including the best-fit coefficients for the line source transfer mobilities, are provided in Attachment N.3C, Vibration Propagation Measurement Results.

Table 5-2. Summary of Vibration Propagation Test Sites

Segment	Test Site	Location	Sensor Positions (in feet or by location)
Duwamish	V-E (surface)	Harbor Island Machine Works, 3431 11th Avenue Southwest	25, 50, 75, 100, 125, 150
Duwamish	V-D (surface)	Bike path at 22nd Avenue Southwest at West Seattle Bridge	29, 52, 75, 100, 125, 160, 200
Delridge	V-C (surface)	Southwest Dakota Street at 25th Avenue Southwest	25, 50, 75, 100, 125, 150, 195
West Seattle Junction	V-B (surface)	Southwest Genesee Street at 32nd Avenue Southwest	25, 50, 75, 100, 125, 150, 200
West Seattle Junction	V-3 (borehole)	Alley at Southwest Genesee Street and 35th Avenue Southwest	0, 45, 75, 105, 123, 150, 200
West Seattle Junction	V-2 (borehole)	39th Avenue Southwest at Southwest Genesee Street	0, 25, 50, 75, 100, 150, 200
West Seattle Junction	V-A (surface)	Alley on 41st Avenue Southwest, north of Southwest Alaska Street	25, 50, 75, 100, 125, 150

Figures 5-10 and 5-11 show the measured vibration propagation test results at or close to 100 feet for surface measurement sites and at or close to 150 feet for borehole measurement sites, respectively. For the surface sites, the line source transfer mobility is presented, and for borehole sites, the point source transfer mobility is presented because it is not possible to measure at a line of impact points. The point source transfer mobility has lower amplitudes compared to the line source transfer mobility.

Observations from the vibration propagation test results were as follows:

- Surface sites:
  - Site V-E shows high line source transfer mobility levels at frequencies below 40 hertz and lower line source transfer mobility levels above 40 hertz. This site was on Harbor Island, which is composed of reclaimed land. The data from this site are only applied to Harbor Island Machine Works, the sensitive receiver where the data were collected.
  - In general, the surface sites show the highest line source transfer mobility levels in the 30- to 60-hertz range, with levels decreasing at higher frequencies.
  - The data show generally good agreement across different measurement sites with the exception of Site V-E. Site V-B does show more efficient vibration propagation at 40- and 50-hertz compared to the other sites.
- Borehole sites:
  - At borehole vibration propagation test sites, the transfer mobilities generally have flatter spectra than the surface sites. This generally results in lower levels in the 30- to 60-hertz range, but higher levels at higher frequencies.
  - The data shows generally good agreement at the two borehole measurement sites.

Figure 5-10. Measured Line Source Transfer Mobility at 100 Feet for Surface Sites

Figure 5-11. Measured Point Source Transfer Mobility at 150 Feet for Borehole Sites

6 IMPACT ASSESSMENT

Sound Transit performed a detailed noise and vibration impact assessment based on the criteria discussed in Chapter 3, Noise and Vibration Impact Criteria, using the methods and projections described in Chapter 4, Noise and Vibration Impact Analysis Assumptions and Methods, of this report. For areas with potential noise or vibration impacts, mitigation measures are evaluated and proposed as described in Chapter 7, Noise and Vibration Mitigation Measures. Potential noise and vibration impacts from light rail transit operations according to the FTA Guidance Manual (2018) are provided in the following sections. An assessment of construction noise levels was also performed, and is described in Section 6.2, Construction Noise Impacts.

Assessment details are provided in the following attachments:

- Attachment N.3A: Noise Measurement Data, Site Details and Photographs
- Attachment N.3B: Vibration Measurement Site Photographs
- Attachment N.3C: Vibration Propagation Measurement Results
- Attachment N.3D: Maps of Noise Impact Assessment
- Attachment N.3E: Maps of Vibration Impact Assessment
- Attachment N.3F: Tables of Noise Predictions
- Attachment N.3G: Tables of Vibration Predictions
- Attachment N.3H: Vibration Analysis of Category 1 Uses and Special Buildings

Summary discussions of the results are provided in the following sections.

6.1 Operational Noise Impacts

6.1.1 Transit Noise Impact Analysis

This section provides the results of the detailed noise analysis for the West Seattle Link Extension. The study area for the West Seattle Link Extension is based on measured noise levels of the existing fleet of Sound Transit light rail vehicles, operational schedule, and train speeds, and is large enough to capture all potential noise impacts from system operations. System operations includes all light rail-related noise sources (wayside noise, bells, crossovers) ancillary facilities, and identification of areas with potential wheel squeal. Based on this information, the analysis includes noise-sensitive properties within at least 500 feet of the track alignments. This amounts to over 70 analysis locations in the Duwamish Segment, over 450 in Delridge, and nearly 900 in the West Seattle Junction area. The locations analyzed include single- and multi-family residences, fire stations, schools, daycares, a recording studio, parks, and other FTA noise-sensitive land uses.

Figures displaying the locations of noise impacts and tables with detailed noise analysis information are provided in Attachment N.3D and Attachment N.3F.

6.1.1.1 No Build Alternative

Under the No Build Alternative, traffic noise levels would continue to be dominated by major and minor arterial roadways, aircraft over flights, unrelated construction projects, and commercial, industrial, and residential activities. Because there would be no light rail construction or operations, no light rail-related noise impacts are predicted.

6.1.1.2 Build Alternatives

The noise impacts are summarized by alternative and include moderate and severe impacts for each of the three FTA categories. A general discussion of impacts for each of the alternatives is also included. Detailed information on the impacts are provided graphically on area maps in Attachment N.3D and tables of the noise projections by receiver are provided in Attachment N.3F.

SODO Segment

There are no FTA noise-sensitive properties in the SODO Segment; therefore, no operational noise analysis was performed.

Duwamish Segment

A summary of the noise impacts for the Duwamish Segment is shown in Table 6-1 and on Figure 6-1. Detailed figures displaying the locations of noise impacts and tables with detailed noise analysis information are provided in Attachments N.3D and N.3F.

Table 6-1. Summary of Light Rail Noise Impacts by Alternative for the Duwamish Segment

Alternatives and Design Options	Category 1 Noise Impacts	Category 2 Moderate Noise Impacts	Category 2 Severe Noise Impacts	Category 3 Noise Impacts	Total Noise Impacts
Preferred South Crossing Alternative (DUW-1a)	**0**	**25 to 45**	**1 to 6**	**0**	**29 to 47**
South Crossing South Edge Crossing Alignment Option (DUW-1b)	0	34	1	0	35
North Crossing Alternative (DUW-2)	0	1	0	0	1

Notes:

The numbers presented are the number of units, counted by individual residences, including individual units of multi-family structures, and number of structures for other uses, like schools, churches and parks. Category 2 parcels are evaluated with the 24-hour Ldn and Category 1 and 3 are evaluated with the peak hour Leq.

Ranges reflect differences from connecting to different alternatives in adjacent segments. The total impacts are based on individual alternatives and connection options and not the high and low of each impact type shown in the table.

The Duwamish Segment includes the area between South Forest Street at the east end of the segment and Southwest Charlestown Street at the west end of the segment.

Preferred Alternative DUW-1a and Option DUW-1b would have the most overall impacts in the Duwamish Segment. These alternatives could connect to any of the SODO and Delridge segment alternatives. Noise impact differences between the two alternatives are affected by five factors – retained-cut segments, receiver elevation, track elevation, crossovers, and track location across the Duwamish Waterway. Alternative DUW-2 would have the fewest noise impacts of all the Duwamish Segment alternatives. All alternatives except Alternative DUW-2 transition to a retained-cut section along the West Duwamish Greenbelt.

The alignment for Alternative DUW-2 would be farther north than the other alternatives (north of the West Seattle Bridge) and far enough away from residential housing to not cause noise impacts in the Pigeon Point or Riverside neighborhoods.

Each of the Duwamish Segment alternatives would have a noise impact at Fire Station 14 due to proximity to the guideway and crossovers.

Preferred South Crossing Alternative (DUW-1a)

Preferred Alternative DUW-1a, when connecting to Preferred Option DEL-6b and Alternative DEL-7, would have more overall severe noise impacts than the other Duwamish Segment Build Alternatives. A severe impact was identified at Fire Station 14 at 3224 4th Avenue South. The remaining severe impacts were identified at single-family homes along the north end of 22nd Avenue Southwest, where homes would have minimal shielding from light rail noise.

When connecting to Preferred Option DEL-6b and Alternative DEL-7, moderate noise impacts were identified at the following locations:

- A cluster of single-family residences along 17th Avenue Southwest, where the homes would have line of sight to the new light rail structure
- Between 19th Avenue Southwest and 21st Avenue Southwest along Southwest Charlestown Street, where the alignment would be elevated, approaching Pigeon Point
- Along the north end of 22nd Avenue Southwest, where residences uphill from the guideway will have minimal or no acoustical shielding

Fire Station 36 at 3600 23rd Avenue Southwest would not have a noise impact because of the high existing noise levels and because of the distance and shielding from the elevated structure. Noise from light rail operations on the guideway would be shielded from impacting Seattle Fire Station 36 by the structure itself. The guideway would act as a noise barrier and would effectively block noise from going downward toward the Fire Station 36 building.

When connecting to Alternative DEL-1a and Option DEL-1b, there would be fewer noise impacts due to higher track elevations. However, connections to Alternative DEL-2a and Option DEL-2b would have a lower track elevation, resulting in impacts more similar to Preferred Alternative DUW-1a when connecting to Preferred Option DEL-6b and Alternative DEL-7. When connecting to Alternative DEL-3 or Alternative DEL-4, Preferred Alternative DUW-1a would have fewer moderate noise impacts due to the alignment being farther from single- and multi-family residences along 22nd Avenue Southwest and not having a crossover on Pigeon Point.

When connecting to Alternative DEL-5 or Alternative DEL-6a, Preferred Alternative DUW-1a would have fewer predicted noise impacts than the connections with Alternative DEL-3 or Alternative DEL-4. The alignment would be partially shielded by a retained cut along Pigeon Point when connecting to Alternative DEL-5 and due to the aerial track when connecting to Alternative DEL-6a.

Following Sound Transit policy and the discussion in Section 4.1.1.5, Operations Plan, the Duwamish Segment was reviewed for curves with the potential for wheel squeal. Under Preferred Alternative DUW-1a, there would be several curves located primarily near the existing Operations and Maintenance Facility Central. The first two curves with radii of 125 feet and 160 feet would be at the north and south of the entrance to the Operations and Maintenance Facility Central, followed by 150 feet curves just as the tracks branch off to the facility's connections. The northern connection would have one curve at 150 feet with one additional curve radii at the tail end of 140 feet. The south connection only would have two curves both with a radius of 150 feet. To the southwest of the facility, there would be one more curve before crossing the Duwamish Waterway with a 1,150-foot radius by 4th Avenue South, which may impact Fire Station 14. West of the Duwamish Waterway crossing there would be only one curve with a radius less than 1,250 feet; this curve would have a 950-foot radius and would be north of 20th Avenue Southwest near the West Seattle Bridge, by single- and multi-family residences. The majority of crossovers for Preferred Alternative DUW-1a would be for Operations and Maintenance Facility Central access. They would consist of single and double crossovers at the facility's entrances and north and south of the connection guideways.

While most crossovers would be within commercial/industrial areas, the crossovers at the south entrance would be close to Fire Station 14 and therefore were included in the analysis. One additional crossover would be located north of 22nd Avenue Southwest just before transitioning to the Delridge Segment when connecting to Preferred Option DEL-6b and Alternative DEL-7. The crossover has the potential to result in noise impacts on residences in this area. When connecting to Alternative DEL-5 and Alternative DEL-6a the crossover would be located north of 21st Avenue Southwest. There are no crossovers in the Duwamish Segment Pigeon Point area when connecting to Alternative DEL-1a, Option DEL-1b, Alternative DEL-2a, Option DEL-2b, Alternative DEL-3, or Alternative DEL, because the crossover is located in the Delridge Segment under these alternatives.

South Crossing South Edge Crossing Alignment Option (DUW-1b)

Option DUW-1b would have one severe noise impact at Fire Station 14. Moderate impacts that would affect single-family and multi-family residences were identified at the same areas as described under Preferred Alternative DUW-1a. However, Option DUW-1b would have slightly more noise impacts at residences on the east side of Pigeon Point than Preferred Alternative DUW-1a due to the southern alignment across Harbor Island.

Option DUW-1b would have the same curves and crossovers at the existing Operations and Maintenance Facility Central as Preferred Alternative DUW-1a and only one curve with the potential for wheel squeal in the Pigeon Point area near the West Duwamish Greenbelt. This curve would have a 950-foot radius, and would be north of 20th Avenue Southwest near the West Seattle Bridge by single- and multi-family residences. There would be no crossovers in the Pigeon Point area because the crossover would be located in the Delridge Segment for these alternatives.

North Crossing Alternative (DUW-2)

Alternative DUW-2 would have the least noise impacts for the Duwamish Segment. It would have no severe noise impacts and one moderate noise impact at Fire Station 14. It would not have impacts on any residential properties in the Pigeon Point area.

Most curves and crossovers for the Alternative DUW-2 would be for the Operations and Maintenance Facility Central access. This would include several curves, a 125-foot-radius curve followed by three more curves at 150-foot, 300-foot, and 130-foot radii. There would also be a 1,250-foot-radius curve between the north and south facility access near 4th Avenue South, which may affect Fire Station 14. The south facility access would have six curves with three of those curves having a radius between 1,100 and 1,000 feet. The remaining south curves would be at the far east end of the main guideway and have curve radii between 200 and 250 feet. There would be additional tight-radius curves associated with the connection to the Operations and Maintenance Facility Central. Alternative DUW-2 would have one more curve after crossing west over the Duwamish Waterway between West Marginal Way Southwest and Chelan Avenue Southwest with a 900-foot curve radius, but this curve would be in a commercial and industrial area.

Duwamish Segment Bus Operations

Bus operations in the Duwamish Segment would remain on existing roadways; therefore, no noise analysis for buses was required.

Delridge Segment

Noise impacts for the Delridge Segment are shown in Table 6-2 and on Figure 6-2. Some of the impacts in this segment are in the Duwamish Segment; however, these impacts are caused by the alignment within the Delridge Segment. Impacts shown in Table 6-2 assume a connection to Preferred Alternative DUW-1a in the Duwamish Segment. Impacts would be reduced when connecting to Alternative DUW-2. Detailed figures displaying the locations of noise impacts and tables with detailed noise analysis information are provided in Attachments N.3D and N.3F.

The Delridge Segment generally includes the area between Southwest Charlestown Street (west of Delridge Way Southwest) at the east end of the segment and 31st Avenue Southwest at the west end of the segment. Alternative DEL-6a would have the fewest overall noise impacts because it would be farther from most residences, followed by Preferred Option DEL-6b, while Alternatives DEL-1a, DEL-3, DEL-4, and DEL-5 would have the most overall noise impacts because they are closest to the greatest number of residences. Alternative DEL-5 and Alternative DEL-7 would have the most severe noise impacts.

Preferred Option DEL-6b and Alternative DEL-7 would have similar alignments north of Southwest Yancy Street, where Preferred Option DEL-6b and Alternative DEL-7 would be just north of Southwest Yancy Street. Preferred Option DEL-6b would turn south near 32nd Avenue Southwest before transitioning to a retained cut near the West Seattle Junction Segment. Alternative DEL-7 would continue slightly southwest across the West Seattle Bridge before going into a tunnel. Due to speed restrictions along the curve west of Southwest Avalon Way, Preferred Option DEL-6b would have slightly slower speeds, and thereby lower noise levels, than Alternative DEL-7.

Table 6-2. Summary of Light Rail Noise Impacts by Alternative for the Delridge Segment

Alternatives and Design Options	Category 1 Noise Impacts	Category 2 Moderate Noise Impacts	Category 2 Severe Noise Impacts	Category 3 Noise Impacts	Total Noise Impacts
Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	**0**	**156**	**5**	**0**	**161**
Dakota Street Station Alternative (DEL-1a)	1	228 to 240	5 to 6	0	234 to 247
Dakota Street Station North Alignment Option (DEL-1b)	1	203	14	0	218
Dakota Street Station Lower Height Alternative (DEL-2a)	1	218	22	0	241
Dakota Street Station Lower Height North Alignment Option Alternative (DEL-2b)	1	154	23	0	178
Delridge Way Station Alternative (DEL-3)	1	242	2	0	245
Delridge Way Station Lower Height Alternative (DEL-4)	1	217	28	0	246
Andover Street Station Alternative (DEL-5)	0	208	43	0	251
Andover Street Station Lower Height Alternative (DEL-6a)	0	55	13	0	68
Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)	0	186	42	0	228

Note: The numbers presented are the number of units, counted by individual residences, including individual units of multi-family structures, and number of structures for other uses, like schools, churches and parks. Category 2 parcels are evaluated with the 24-hour Ldn and Category 1 and 3 are evaluated with the peak hour Leq.

FIGURE 6-2
Noise Impacts (before mitigation)
Delridge Segment

West Seattle Link Extension

0 500 1,000 Feet

N

Both Alternative DEL-1a and Option DEL-1b would share similar track alignment and elevation except along Southwest Genesee Street between 28th Avenue Southwest and Southwest Avalon Way, where Alternative DEL-1a would be on the south side of the Southwest Genesee Street right-of-way while Option DEL-1b would shift to the north side of Southwest Genesee Street.

Alternative DEL-2a and Option DEL-2b would have similar alignments at lower elevations than Alternative DEL-1a and Option DEL-1b. Under Alternative DEL-2a, the guideway would be along the northern edge of the West Seattle Golf Course at 4470 35th Avenue Southwest, south of Southwest Genesee Street, while Option DEL-2b runs north of Southwest Genesee Avenue. Both alternatives would enter tunnel portals east of the West Seattle Junction Segment.

Both Alternatives DEL-3 and DEL-4 would travel farther south along Delridge Way than Alternative DEL-1a, Option DEL-1b, Alternative DEL-2a, and Option DEL-2b. While they both would have different guideway elevations, they would share similar alignments until Southwest Genesee Street between 28th Avenue Southwest and Southwest Avalon Way.
Alternative DEL-3 would run along the south side of the Southwest Genesee Street right-of-way, while Alternative DEL-4 would travel along the northern edge of the West Seattle Golf Course, south of Southwest Genesee Street, just before the West Seattle Junction Segment.

Alternative DEL-5 and Alternative DEL-6a would both be along Southwest Andover Street. Though they would have different guideway elevations, their alignments would be similar until they reach the intersection of 28th Avenue Southwest and Southwest Andover Street. From there, Alternative DEL-5 would turn south to travel along Southwest Avalon Way and Alternative DEL-6a would continue west, turning south just east of the West Seattle Bridge before entering a retained cut near the West Seattle Junction Segment.

<u>Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)</u>

Preferred Option DEL-6b could connect to all Build Alternatives in the Duwamish Segment and to Preferred Option WSJ-5b and Alternative WSJ-5a in the West Seattle Junction Segment.

The only severe noise impacts were identified at five single-family residences along the north end of 23rd Avenue Southwest where the alignment would transition to the south, west of 23rd Avenue Southwest. The distances from these residences to the nearest station range from 30 feet to 165 feet.

Moderate impacts would be felt throughout the alignment corridor. On the east side of this segment, near the Delridge Station, moderate noise impacts were identified at Youngstown Flats, a five-story apartment building at 4040 26th Avenue Southwest, on the corner of Southwest Dakota Street and 26th Avenue Southwest, in close proximity to the guideway and station. The train-mounted warning bells at the Delridge Station would contribute to a number of the moderate noise impacts identified.

Other moderate noise impacts are found at most first-row single- and multi-family residences along Southwest Yancy Street, including housing for Transitional Resources (a non-profit behavioral health center and supportive housing facility), where there is no acoustical shielding. The guideway is approximately 100 feet from many of the residential buildings. Some second- or third-story second-row residences would also have moderate impacts when there is no acoustical shielding from first-row buildings.

The west end of the alignment has moderate impacts at most first-row residences along 32nd Avenue Southwest, where the guideway runs east of the West Seattle Bridge before transitioning to the West Seattle Junction Segment. Impacts were also identified near the intersection of Southwest Avalon Way and Southwest Andover Street, where the guideway begins its transition south and east of the West Seattle Bridge. Residences with noise impacts in this area include portions of the Transitional Resources buildings along Southwest Avalon Way.

A noise analysis was performed at the frequent use areas in Longfellow Creek Natural Area and no noise impacts were identified.

Following Sound Transit policy and the discussion in Section 4.1.1.6, Wheel Squeal and Wheel-Flanging Noise, the Delridge Segment was reviewed for curves with the potential for wheel squeal. Preferred Option DEL-6b would have a 625-foot-radius curve north of Delridge Station on Delridge Way Southwest near the intersection with Southwest Charlestown Street. South of Delridge Station, a 675-foot-radius curve and a 625-foot-radius curve would be near the intersection of Southwest Andover Street and 26th Avenue Southwest. There would be one additional curve of 950-foot radius south of the intersection of Southwest Andover Street and 32nd Avenue Southwest.

There would be no crossovers in the Delridge Segment under Preferred Option DEL-6b.

Dakota Street Station Alternative (DEL-1a)

Alternative DEL-1a could connect to all Build Alternatives in the Duwamish Segment and Alternative WSJ-1, Alternative WSJ-2, and Alternative WSJ-4 in the West Seattle Junction Segment.

Alternative DEL-1a could connect to Preferred Alternative DUW-1a in the Duwamish Segment and Alternative WSJ-2 in the West Seattle Junction Segment. The range of impacts for Alternative DEL-1a would depend on the connection in the Duwamish Segment. When connecting to Preferred Alternative DUW-1a, Alternative DEL-1a would have the most impacts. When connecting to Alternative DUW-2, it would have the least moderate noise impacts predicted for the area north of the station. This alternative would have less severe noise impacts than other Delridge Segment alternatives except Preferred Option DEL-6b, Alternative DEL-3, and Alternative DEL-6a.

Most of the severe noise impacts would be found near the east end of the alignment, which would be in close proximity to the guideway and station. Severe noise impacts would affect single-family residences on 23rd Avenue Southwest near Southwest Andover Street and at the southeast corner of 26th Avenue Southwest and Southwest Nevada Street along with upper-floor units at a multi-family complex, The Edge Apartments at 3101 Southwest Avalon Way. Single-family residences along Delridge Way Southwest, Southwest Andover Street, 22nd Avenue Southwest, and 23rd Avenue Southwest are predicted to have moderate noise impacts due to proximity to the guideway and a double crossover. The station would contribute to a number of moderate noise impacts due to noise from the train-mounted warning bells.

As described in Chapter 5, Affected Environment, there is one building in the Delridge Segment that meets the requirements for analysis under the FTA Category 1 criteria. Secret Studio Records/Studio 1208, on the southwest corner of 23rd Avenue Southwest and Southwest Andover Street, is a wooden-framed structure built in 1916 that has been converted to a recording studio and is predicted to have a moderate noise impact.

A cluster of moderate noise impacts were identified at The Edge Apartments. Noise impacts at residences along 23rd Avenue Southwest and Southwest Andover Street would be from a combination of noise from the light rail operations and a nearby crossover.

West of the station, lower ambient noise levels would result in a lower impact criterion and nearly all the residences in between Southwest Adams Street and Southwest Nevada Street west of 26th Avenue Southwest are predicted to have moderate noise impacts. As the alignment would make its way onto Southwest Genesee Street, single- and multi-family residences on Southwest Nevada Street between 26th Avenue Southwest and 28th Avenue Southwest would have moderate noise impacts from a combination of low existing ambient noise levels, close proximity to the guideway, and noise from the station.

A noise analysis was performed at the frequent use areas in Longfellow Creek Natural Area and no noise impacts were identified.

Three curves at 1,250 feet or less were identified under Alternative DEL-1a. The first curve, with a 625-foot radius, would be along Delridge Way Southwest between Southwest Dakota Street and Southwest Andover Street. Another 625-foot-radius curve would be just north of Southwest Genesee Street and slightly west of the intersection with 26th Avenue Southwest. The final curve, at a 1,250-foot radius, would be at the west end of the alternative on Southwest Genesee Street between 30th Avenue Southwest and Southwest Avalon Way.

Under the alternative, there would be one crossover along Delridge Way Southwest at the intersection with Southwest Andover Street. The crossover would be near single- and multi-family residences and was included in the light rail analysis. The crossover would contribute to noise impacts identified in this area.

Dakota Street Station North Alignment Option (DEL-1b)

Option DEL-1b could connect to all Build Alternatives in the Duwamish Segment and Alternative WSJ-1, Alternative WSJ-2, and Alternative WSJ-4 in the West Seattle Junction Segment.

Option DEL-1b shares a similar alignment and track elevation with Alternative DEL-1a in the northeast end of the segment. However, Option DEL-1b would transition to the north side of Southwest Genesee Street just east of 28th Street Southwest.

There would be several severe noise impacts with this alternative. Severe impacts would occur at single-family residences along Southwest 23rd Avenue and Southwest Andover Street and along 26th Avenue Southwest and Southwest Nevada Street. The remaining severe noise impacts would be at the west end of the alternative, and would affect multi-story apartment buildings on the northwest and southwest corner of Southwest Genesee Street and Southwest Avalon Way. All of these apartments would be in close proximity to the guideway as it would be approaching Avalon Station.

Moderate noise impacts were also identified for Option DEL-1b. Youngstown Flats apartments would receive the largest cluster of moderate noise impacts, due to its close proximity to the elevated guideway and the station. Moderate impacts would occur at single- and multi-family residences along the west slope of Pigeon Point, along 22nd Avenue Southwest and 23rd Avenue Southwest. Moderate impacts were also identified south of Southwest Andover Street, along Delridge Way Southwest and 23rd Avenue Southwest at single- and multi-family residences.

Additional moderate noise impacts would occur east of the station along 25th Avenue Southwest at Southwest Genesee Street and along Delridge Way Southwest south of Southwest Dakota Street. The alternative would travel on Southwest Genesee Street where single- and multi-family residences on Southwest Nevada Street between 26th Avenue Southwest and 28th Avenue Southwest would have moderate noise impacts due to the close proximity to the guideway, noise from the station, and lower existing noise levels.

Option DEL-1b would have slightly fewer moderate noise impacts at single- and multi-family residences on Southwest Nevada Street between 30th Avenue Southwest and 28th Avenue Southwest than the Alternative DEL-1a because the alignment would travel along the north of side of Southwest Genesee Street rather than the south side, it could result in more residential displacements. Another cluster of moderate noise impacts was identified at The Edge Apartment buildings on Southwest Genesee Street between 30th Avenue Southwest and Southwest Avalon Way. These impacts would be caused by the close proximity to the guideway and station along with topographical conditions, which vary greatly, placing some receiver

locations with balconies above the light rail tracks, increasing impacts. The last cluster of single- and multi-family residences with predicted moderate noise impacts would be between Southwest Avalon Way and 32nd Avenue Southwest on Southwest Genesee Street. Residences in this cluster would also be elevated and within 500 feet of the station.

The FTA Category 1 land use, the Secret Studio Records/Studio 1208, on the southwest corner of 23rd Avenue Southwest and Southwest Andover Street, is predicted to have a moderate noise impact.

A noise analysis was performed at the frequent use areas in Longfellow Creek Natural Area and no noise impacts were identified.

Under Option DEL-1b, there would be a 625-foot-radius curve just west of Delridge Way between Southwest Dakota Street and Southwest Andover Street followed by another 625-foot-radius curve north of Southwest Genesee Street and west of 26th Avenue Southwest where the track would curve south to go west along Southwest Genesee Street. The last curve for the alternative, with an 1,800-foot radius, would be midway between 28th Avenue Southwest and 30th Avenue Southwest on Southwest Genesee Street.

Option DEL-1b would have only one crossover along Delridge Way Southwest at the intersection with Southwest Andover Street. The crossover would be near single- and multi-family residences and was included in the analysis. The crossover would contribute to noise impacts identified in this area.

Dakota Street Station Lower Height Alternative (DEL-2a)

Alternative DEL-2a could connect to all Build Alternatives in the Duwamish Segment and to Alternative WSJ-3a or Option WSJ-3b in the West Seattle Junction Segment. It would have a lower track alignment than Alternative DEL-1a, to connect to these tunnel alternatives. The lower guideway elevations for the Alternative DEL-2a would have more severe and moderate impacts than alternatives with higher profile guideway elevations.

Severe noise impacts along Delridge Way Southwest would be similar to Alternative DEL-1a on the east side of the alignment, with severe noise impacts at single- and multi-family residences along 23rd Avenue Southwest, south of Andover Street and 26th Avenue Southwest, near the station. Along Southwest Genesee Street, severe noise impacts would occur at most residences adjacent to the guideway between 28th Avenue Southwest and 30th Avenue Southwest due to close proximity to the guideway.

Moderate impacts were identified at single- and multi-family residences between the north end of 22nd Avenue Southwest and Delridge Way Southwest to Southwest Andover Street, due in part to the elevation of the receiver relative to the guideway, at the upper floors of multi-family buildings and the Pigeon Point hillside and the general proximity to the guideway and double crossover at Southwest Andover Street. Added noise from bells at the station would cause moderate noise impacts at those residences near the station. East of the station, moderate impacts were identified at single- and multi-family residences between 25th Avenue Southwest and Delridge Way Southwest at Southwest Genesee Street. To the west of the station, the largest cluster of moderate noise impacts would occur at lower level floors of the Youngstown Flats, in addition to the severe noise impacts, as well as at nearly all single- and multi-family residences along Southwest Adams Street and Southwest Nevada Street near 26th Avenue Southwest, where lower existing noise levels would result in a lower criteria level. Additional moderate noise impacts are also predicted at several single- and multi-family residences along Southwest Nevada Street, west of 28th Avenue Southwest.

Secret Studios Records/Studio 1208, on the southwest corner of 23rd Avenue Southwest and Southwest Andover Street, is predicted to have a moderate noise impact.

A noise analysis was performed at the frequent use areas in Longfellow Creek Natural Area and no noise impacts were identified.

Alternative DEL-2a would only have two curves under 1,250 feet, both with a curve radius of 625 feet found just east of Delridge Way between Southwest Dakota Street and Southwest Andover Street and east as the guideway bends to turn west and travel along Southwest Genesee Street.

Alternative DEL-2a would have one crossover along Delridge Way Southwest at the intersection with Southwest Andover Street. The crossover would be near single- and multi-family residences and was included in the light rail analysis. The crossover would contribute to noise impacts identified in this area.

Dakota Street Station Lower Height North Alignment Option (DEL-2b)

Option DEL-2b could connect to all Build Alternatives in the Duwamish Segment and Alternative WSJ-3a and Alternative WSJ-3b in the West Seattle Junction Segment.

Option DEL-2b would generally share a similar track elevation and route with Alternative DEL-2a, but the guideway would have a slightly higher elevation than the Dakota Street Station Lower Height Alternative (DEL-2a). West of the station, Option DEL-2b would travel north of Southwest Genesee Street, rather than south, and would have a lower elevation for connection to the tunnel near the West Seattle Junction Segment. The higher guideway elevation would result in less severe and moderate noise impacts than Alternative DEL-2a.

With this alternative, severe noise impacts would occur at single- and multi-family residences east of the guideway from 23rd Avenue Southwest at Delridge Way to Southwest Dakota Street. A number of factors would contribute to severe noise impacts in this area, including proximity to the guideway, elevation of receiver relative to the guideway, and proximity to a crossover. Severe noise impacts would also occur at single- and multi-family residences on 26th Avenue Southwest west of the station and at some units in the southeast corner of the Youngstown Flats. Other single- and multi-family residences that would have severe noise impacts are along Southwest Genesee Street between 28th Avenue Southwest and 30th Avenue Southwest.

The moderate noise impact locations would be similar to the moderate impacts under Alternative DEL-2a. There would be less impacts with Option DEL-2b because of the slightly higher guideway elevation, which would increase the structural shielding from the far track at many single- and multi-family units along Delridge Way Southwest, with less impacts along Southwest Genesee and Southwest Nevada streets due to track location and residential displacements.

Secret Studio Records/Studio 1208, on the southwest corner of 23rd Avenue Southwest and Southwest Andover Street, is predicted to have a moderate noise impact.

A noise analysis was performed at the frequent use areas in Longfellow Creek Natural Area and no noise impacts were identified.

Option DEL-2b would have two curves with a curve radius of 625 feet found just west of Delridge Way Southwest between Southwest Dakota Street and Southwest Andover Street and as the guideway bends to turn west and travel along Southwest Genesee Street.

Under this option there would only be one crossover along Delridge Way Southwest at the intersection with Southwest Andover Street. The crossover would be near single- and multi-family residences and was included in the light rail analysis. The crossover would contribute to noise impacts identified in this area.

Delridge Way Station Alternative (DEL-3)

Alternative DEL-3 could connect to all Duwamish Segment Build Alternatives and Alternative WSJ-1, Alternative WSJ-2, or Alternative WSJ-4 in the West Seattle Junction Segment.

The only severe noise impacts were identified at upper-floor units at The Edge Apartments. These buildings would also have the highest number of moderate impacts for this alternative. Another cluster of moderate noise impacts would be found at the Youngstown Flats. While the apartment building would be farther from the guideway than with Alternative DEL-1a, Option DEL-1b, Alternative DEL-2a, and Option DEL-2b, the upper floors of the building would have impacts from this alternative. The double crossover north of the station, as well as the elevation of receiver relative to the guideway elevations on the upper floors of multi-family units and proximity to the guideway, would cause moderate noise impacts for single- and multi-family residences from the north end of 22nd Avenue Southwest to Southwest Andover Street and at residences along 23rd Avenue Southwest, Delridge Way Southwest, and 25th Avenue Southwest south of Southwest Andover Street. Moderate residential noise impacts would extend on both sides of the guideway from Delridge Way Southwest to 30th Avenue Southwest, including some residences in between Southwest Genesee Street and Southwest Nevada Street.

Secret Studio Records/Studio 1208, on the southwest corner of 23rd Avenue Southwest and Southwest Andover Street, is predicted to have a moderate noise impact.

A noise analysis was performed at the frequent use areas in Longfellow Creek Natural Area and no noise impacts were identified.

Alternative DEL-3 would have a 625-foot-radius curve north of Delridge Station on Delridge Way Southwest near the intersection with Southwest Andover Street. South of the Delridge Station, a 750-foot-radius curve would be on Delridge Way Southwest between Southwest Dakota Street and Southwest Genesee Street followed by about 625-foot-radius curve on 25th Avenue just north of Southwest Genesee Street as the guideway would begin to turn west.

Alternative DEL-3 would have one crossover along Delridge Way Southwest just at the intersection with 23rd Avenue Southwest. The crossover would be near single- and multi-family residences and was included in the analysis. The crossover would contribute to noise impacts identified in this area.

Delridge Way Station Lower Height Alternative (DEL-4)

Alternative DEL-4 could connect to all Build Alternatives in the Duwamish Segment and Alternative WSJ-3a and Option WSJ-3b in the West Seattle Junction Segment. It would have a similar alignment as Alternative DEL-3 but would have a lower track elevation, resulting in a slight reduction in moderate impacts but an increase in severe noise impacts.

Three single-family residences between Southwest Dakota Street and Southwest Genesee Street on 25th Avenue Southwest would have a severe noise because of the elevation of the receiver relative to the guideway. Many of the other single- and multi-family residences in the area are predicted to have moderate noise impacts. Other severe noise impacts would occur at first-row single- and multi-family housing on Southwest Genesee Street between 28th Avenue Southwest and 30th Avenue Southwest, while nearly all other residences within this block would have moderate noise impacts due to second and third row acoustical shielding provided by buildings directly in front of them. One single-family residence on the southeast corner of Southwest Nevada Street and 28th Avenue would have a severe noise impact despite being further away from the guideway due to the elevation of the receiver relative to the guideway and lack of shielding.

The largest concentration of moderate noise impacts would occur where the guideway would be lower and the alignment transitions from Delridge Way Southwest to travel west along Southwest Genesee Street, between 23rd Avenue Southwest and 26th Avenue Southwest. Another concentration of moderate noise impacts would occur at the Youngstown Flats. While the apartment building would be further from the guideway, impacts would occur at the upper floors, which are in close proximity to the station. The double crossover north of the station, as well as high receiver elevation and proximity to the guideway, would cause moderate noise impacts for single- and multi-family residences along 22nd Avenue Southwest near Southwest Charleston and south towards Southwest Andover Street. As the guideway would decrease in elevation, it would cause moderate noise impacts for residences from 26th Avenue Southwest to 30th Avenue Southwest. West of 30th Avenue Southwest, moderate impacts are predicted for The Edge Apartments, which would be in close proximity to the guideway.

Secret Studio Records/Studio 1208, on the southwest corner of 23rd Avenue Southwest and Southwest Andover Street, is predicted to have a moderate noise impact.

A noise analysis was performed at the frequent use areas in Longfellow Creek Natural Area and no noise impacts were identified.

Alternative DEL-4 would have a 625-foot-radius curve north of Delridge Station on Delridge Way Southwest near the intersection with Southwest Andover Street. South of Delridge Station, a 750-foot-radius curve would be on Delridge Way Southwest between Southwest Dakota Street and Southwest Genesee Street followed by about 625-foot-radius curve on 25th Avenue Southwest, just north of Southwest Genesee Street as the guideway would begin to turn west.

There would be one crossover in Alternative DEL-4 along Delridge Way Southwest at the intersection with 23rd Avenue Southwest. The crossover would be near single- and multi-family residences and was included in the light rail analysis. The crossover would contribute to noise impacts identified in this area.

Andover Street Station Alternative (DEL-5)

Alternative DEL-5 could connect to all Build Alternatives in the Duwamish Segment and Alternative WSJ-1, Alternative WSJ-2, and Alternative WSJ-4 in the West Seattle Junction Segment. This alternative would travel west of Delridge Way Southwest and head south until turning west along Southwest Andover Street. It then would turn south on Southwest Avalon Way. This alternative would have the most overall noise impacts and most severe noise impacts compared to the other Delridge Segment alternatives because of the close proximity of the guideway to several large multi-family units along Southwest Avalon Way.

All of the severe noise impacts would be at single- and multi-family apartments and condominiums along 32nd Avenue Southwest and Southwest Avalon Way between Southwest Andover Street and Southwest Genesee Street. Not only would many of the buildings be close to the guideway, but many severe impacts at multi-family residences would occur at upper-floor units overlooking the guideway.

Residences predicted to have moderate impacts include the north-facing units of the Youngstown Flats and the nearby single-family residences on 26th Avenue Southwest. While the structures would be more than 300 feet away from the guideway, the area itself has lower noise levels than other surrounding areas and there is little, if any, acoustical shielding. Moderate noise impacts would occur for first-row residences along Southwest Yancy Street between 28th Avenue Southwest and 30th Avenue Southwest, including housing for Transitional Resources, as well as single- and multi-family residences on the east corners of Southwest Dakota Street and Southwest Adams Street at 30th Avenue Southwest.

West of the guideway along Southwest Avalon Way, moderate noise impacts were identified at most first-row housing with no acoustical shielding between Southwest Yancy Street and Southwest Genesee Street. Another cluster of moderate noise impacts was identified at several multi-story apartment buildings on Southwest Genesee Street and between Southwest Avalon Way and 30th Avenue Southwest as well as single- and multi-family homes along 32nd Avenue Southwest. Many of the buildings that would have moderate noise impacts have limited to no acoustical shielding, and would just meet the moderate noise level criteria, at 1 to 2 dB over the criteria level. First-row single- and multi-family residences on Southwest Avalon Way are also predicted to have moderate noise impacts. Residences in this area would have lower local noise levels and also just meet the moderate noise level criteria.

A noise analysis was performed at the frequent use areas in Longfellow Creek Natural Area and no noise impacts were identified.

Alternative DEL-5 would have three curves with a radius under 1,250 feet. The first, with a 625-foot radius, would be just slightly west of the intersection with Delridge Way Southwest and Southwest Andover Street. As the guideway would begin to turn south before traveling along Southwest Avalon Way, a 1,000-foot-radius curve would be on Southwest Yancy Street at the intersection with 28th Avenue Southwest and Southwest Avalon Way. The final curve of 625 feet would be west of Southwest Avalon Way near the intersection with Southwest Genesee Street where the track would begin to curve east again before Avalon Station in the West Seattle Junction Segment.

Andover Street Station Lower Height Alternative (DEL-6a)

Alternative DEL-6a could connect to all Build Alternatives in the Duwamish Segment and Preferred Option WSJ-5b and Alternative WSJ-5a in the West Seattle Junction Segment. This alternative would travel southwest of Delridge Way Southwest and then travel west across Southwest Andover Street before turning south again along the east side of the West Seattle Bridge as it transitions to Fauntleroy Way Southwest. This alternative would have the fewest overall noise impacts and the fewest moderate noise impacts.

All of the severe noise impacts would occur at a single-family residences on 32nd Avenue Southwest between Southwest Andover Street and Southwest Genesee Street, where residences would have minimal to no acoustical shielding and would be in close proximity to the guideway.

The largest concentration of moderate impacts would occur at the upper-level units of the City Views Apartments on Southwest Bradford Street west of Southwest Avalon Way and north of Southwest Andover Street. Additional moderate impacts would occur at the Youngstown Flats and a single-family residence across from the apartment building on 26th Avenue Southwest. First-row housing along 32nd Avenue Southwest between Southwest Yancy Street and Southwest Genesee Street are also predicted to have moderate noise impacts.

A noise analysis was performed at the frequent use areas in Longfellow Creek Natural Area, and no noise impacts were identified.

Three curves were identified for Alternative DEL-6a. The first, a 625-foot-radius curve, would be just southwest of Delridge Station and north of Southwest Andover Street slightly east of the intersection with Charlestown Street. A 950-foot-radius curve would be near Southwest Yancy Street at the north end of 32nd Avenue Southwest. The last curve, with a 675-foot radius, would be at the Delridge-West Seattle Junction border east of West Seattle Bridge. There are no crossovers within the Delridge Segment under Alternative DEL-6a.

Andover Street Station Lower Height No Avalon Station Tunnel Connection (DEL-7)

Alternative DEL-7 could connect to all Build Alternatives in the Duwamish Segment and Alternative WSJ-6 in the West Seattle Junction Segment. This alternative would travel southwest of Delridge Way Southwest and then west near Southwest Yancy Street before turning slightly southwest and transitioning to a tunnel just before the West Seattle Bridge.

All of the severe noise impacts would occur at the west end of the alignment, with a large cluster of impacts at the Transitional Resources residences along Southwest Yancy Street as well at several single-family houses where residences are in close proximity to the guideway. Other severe impacts would occur at residences along 32nd Avenue Southwest, Andover Way Southwest, and Southwest Avalon Way, including the Transitional Resources building on Southwest Avalon Way and an apartment building on the southwest corner of Southwest Avalon Way and Southwest Andover Street.

The largest concentration of moderate noise impacts would occur at the Youngstown Flats, along with single-family residences adjacent to the apartment building. Other moderate impacts would occur at single- and multi-family households along Southwest Yancy Street and upper-floor units on Southwest Dakota Street between 28th Avenue Southwest and 30th Avenue Southwest, single-family residences along Southwest 32nd Avenue, single- and multi-family residences on Southwest Avalon Way, and the upper-floor units of the City View Apartments.

A noise analysis was performed at the frequent use areas in Longfellow Creek Natural Area and no moderate noise impact would occur from light rail operations.

Alternative DEL-7 would have a 625-foot-radius curve north of Delridge Station on Delridge Way Southwest near the intersection with Southwest Charlestown Street. There are two additional curves south of Delridge Station, a 675-foot-radius curve along the east side of the guideway and 625-foot-radius curve along the west side of the guideway near the intersection of Southwest Andover Street and 26th Avenue Southwest.

There would be no crossovers within the Delridge Segment under Alternative DEL-7.

Delridge Segment Bus Operations

Bus operations were reviewed for potential noise impacts. Bus operations under Alternatives DEL-1a, DEL-1b, DEL-2a, DEL-2b, DEL-3, DEL-4, DEL-5, and DEL-6a would occur on existing roadways, including Delridge Way Southwest, Southwest Andover Street, 25th Avenue Southwest and 26th Avenue Southwest, and no analysis was required. For Preferred Option DEL-6b and Alternative DEL-7, southbound buses would connect to the Delridge Station through a commercial area near Southwest Charlestown Street, with no noise sensitive land uses; therefore, no impacts were identified.

West Seattle Junction Segment

Noise impacts for the West Seattle Junction Segment are shown in Table 6-3 and on Figure 6-3. Alternative WSJ-3a, Option WSJ-3b, and Alternative WSJ-6 would be entirely in tunnels and would not have any airborne noise impacts; therefore, they are not discussed further in this section. Preferred Option WSJ-5b and Alternative WSJ-5a would have the fewest number of airborne noise impacts in the West Seattle Junction Segment. Alternative WSJ-1, Alternative WSJ-2, and Alternative WSJ-4 assume a connection to Alternative DEL-1a in the Delridge Segment. Connections to other Delridge Segment alternatives could result in some moderate impacts changing to severe impacts, but the overall number of impacts would be similar. Detailed figures displaying the locations of noise impacts and tables with detailed noise analysis information are provided in Attachments N.3D and N.3F.

Table 6-3. Summary of Light Rail Noise Impacts by Alternative for the West Seattle Junction Segment

Alternatives and Design Options	Category 1 Noise Impacts	Category 2 Moderate Noise Impacts	Category 2 Severe Noise Impacts	Category 3 Noise Impacts	Total Noise Impacts
Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)	**0**	**5**	**0**	**0**	**5**
Elevated 41st/42nd Avenue Station Alternative (WSJ-1)	0	359	54	1	414
Elevated Fauntleroy Way Station Alternative (WSJ-2)	0	275 to 332	15 to 81	0	312 to 356
Tunnel 41st Avenue Station Alternative (WSJ-3a)	0	0	0	0	0
Tunnel 42nd Avenue Station Option (WSJ-3b)	0	0	0	0	0
Short Tunnel 41st Avenue Station Alternative (WSJ-4)	0	140	0	0	140
Medium Tunnel 41st Avenue Station Alternative (WSJ-5a)	0	5	0	0	5
No Avalon Station Tunnel Alternative (WSJ-6)	0	0	0	0	0

Note: The numbers presented are the number of units, counted by individual residences, including individual units of multi-family structures, and number of structures for other uses, like schools, churches, and parks. Category 2 parcels are evaluated with the 24-hour Ldn and Category 1 and 3 are evaluated with the peak hour Leq.

The West Seattle Junction Segment includes the area generally west of 31st Avenue Southwest between Southwest Charlestown Street and Southwest Hudson Street. A noise impact analysis was performed for Preferred Option WSJ-5b, Alternative WSJ-1, Alternative WSJ-2, Alternative WSJ-4, and Alternative WSJ-5a. All other West Seattle Junction Segment alternatives are entirely within tunnels in this segment and therefore would not result in noise impacts from light rail operation.

Of the analyzed alternatives, Preferred Option WSJ-5b and Alternative WSJ-5a would have the least overall noise impacts and no severe noise impacts, and Alternative WSJ-1 and Alternative WSJ-2 would have the most overall noise impacts. Each alternative would have two stations, Avalon Station and Alaska Junction Station, with the exception of Alternative WSJ-6. However, Preferred Option WSJ-5b, Alternative WSJ-4, and Alternative WSJ-5a would enter into a tunnel before the Alaska Junction Station and therefore would have a lower guideway elevation than the other two elevated alternatives. Alternative WSJ-1 would be aligned west of Fauntleroy Way Southwest, between 41st Avenue Southwest and 42nd Avenue Southwest, while Alternative WSJ-2 would be along Fauntleroy Way Southwest.

Noise Impacts (before mitigation)
West Seattle Junction Segment

West Seattle Link Extension

0 500 1,000 Feet
N

Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)

Preferred Option WSJ-5b could connect to Preferred Option DEL-6b and Alternative DEL-6a in the Delridge Segment. Beginning in the Delridge Segment, Preferred Option WSJ-5b begins in a retained cut south of Southwest Yancy Street and follows the east side of the West Seattle Bridge connection to Southwest Genesee Street in the West Seattle Junction Segment. The alignment enters a tunnel north of Fauntleroy Way Southwest at 37th Avenue Southwest. This alternative would have the least overall noise impacts for the above-grade alternatives and no severe noise impacts.

Moderate noise impacts are predicted along 32nd Avenue Southwest just north of the intersection with Southwest Genesee Street. The single-family residences would have moderate noise impacts due to the close proximity to the guideway and little to no acoustical shielding.

Preferred Option WSJ-5b would have a 675-foot-radius curve at the Delridge Segment/West Seattle Junction Segment boundary east of West Seattle Bridge/Fauntleroy Way Southwest. There are no Category 1 Land Uses in the West Seattle Junction Segment. There are no noise-sensitive parks in the West Seattle Junction Segment.

Elevated 41st/42nd Avenue Station Alternative (WSJ-1)

Alternative WSJ-1 could connect to Alternative DEL-1a, Option DEL-1b, Alternative DEL-3, and Alternative DEL-5 in the Delridge Segment. The alternative would travel along the south side of Southwest Genesee Street between 31st Avenue Southwest and Fauntleroy Way Southwest. The alternative would transition to the west side of Fauntleroy Way Southwest. The guideway would turn south in the vicinity of 41st Avenue Southwest and Southwest Alaska Street and continue south to Southwest Hudson Street terminating with a tail track on the west side of 42nd Avenue Southwest. It is the longest West Seattle Junction Segment alternative that was analyzed.

Alternative WSJ-1 would have the most noise impacts of all the West Seattle Junction Segment Build Alternatives.

One Category 3 noise impact would occur at a church on the northwest corner of 39th Avenue Southwest and Southwest Oregon Street, due to close proximity to the guideway. Several single- and multi-family residences on 40th Avenue Southwest would have severe noise impacts due to proximity to the guideway and lack of structural shielding. They would also be in direct line of sight of the double crossover north of Alaska Junction Station. Severe noise impacts would occur at a multi-story mixed-use apartment building on the northwest corner of Southwest Alaska Street and 41st Avenue Southwest. The impacted apartments would be less than 50 feet from the guideway, within 500 feet of Alaska Junction Station and overlook the guideway. The remaining apartments would face the guideway, but would be farther away, and would have moderate noise impacts. Other severe noise impacts would include multi-story apartments on the west side of 42nd Avenue Southwest within 50 feet of Alaska Junction Station; the remaining apartments would have moderate noise impacts. South of Avalon Station, single- and multi-family residences on California Avenue Southwest would all have both moderate and severe noise impacts, with the closest building to the guideway having a severe impact for the top floor. At the end of the alignment, a multi-story apartment building on the southeast corner of California Avenue Southwest and Southwest Hudson Street would have several severe impacts for the uppermost floors due to high receiver elevation and close proximity (20 feet) to the guideway; the remaining residences for the north half of the block would have moderate noise impacts.

The largest cluster of moderate noise impacts includes most of the multi-story apartments and condominiums on the north side of Southwest Avalon Way between Southwest Genesee Street and 35th Avenue Southwest. This block of housing would be adjacent to Avalon Station. Buildings closest to the guideway would have severe impacts at the uppermost floors. Other floors and buildings would have moderate noise impacts. There would also be moderate noise impacts at several single-family residences along 32nd Avenue Southwest north of Southwest Genesee Street.

Additional moderate noise impacts would occur at several multi-family units on 42nd Avenue Southwest, 41st Avenue Southwest, and 40th Avenue Southwest. The affected units would all be within 500 feet of the Alaska Junction Station. Moderate noise impacts are also predicted at a multi-story building within 500 feet of Alaska Junction Station at the north corner of California Avenue Southwest and Erskine Way Southwest, a multi-story apartment building with 300 feet of the double crossover on 40th Avenue Southwest, and several multi-family units, which have minimal or no acoustical shielding from noise at Alaska Station.

The residences along the northwest corner of Fauntleroy Way Southwest and 37th Avenue north of the alignment would have moderate impacts primarily because of guideway proximity and no acoustical shielding. The single- and multi-family residences along 40th Avenue Southwest that would also have moderate noise impacts are affected by proximity to the guideway and being within 300 feet of the double crossover with minimal to no shielding.

Following Sound Transit policy and the discussion in Section 4.1.1.5, the West Seattle Junction Segment was reviewed for curves with the potential for wheel squeal. Alternative WSJ-1 has three curves with the potential for wheel squeal. All of the curves would have a 625-foot radius. These curves would be on Fauntleroy Way Southwest between Southwest Avalon Way and 35th Avenue Southwest as the guideway turns southwest along Fauntleroy Way Southwest, at the intersection of Southwest Alaska Street and 41st Avenue Southwest before Alaska Junction Station, and just west of intersection of Southwest Edmunds Street and 42nd Avenue Southwest after Alaska Junction Station.

Alternative WSJ-1 would have one crossover on the elevated trackway near 40th Avenue Southwest between Southwest Oregon Street and Southwest Alaska Street. The crossover would contribute to noise impacts in this area.

<u>Elevated Fauntleroy Way Station Alternative (WSJ-2)</u>

Alternative WSJ-2 could connect to Alternative DEL-1a, Option DEL-1b, Alternative DEL-3, and Alternative DEL-5. This alternative would travel along the south side of Southwest Genesee Street between 31st Avenue Southwest and Fauntleroy Way Southwest. It would then head southwest on Fauntleroy Way Southwest and continue along the west side of Fauntleroy Way Southwest. The guideway would cross to the east side of Fauntleroy Way Southwest south of Southwest Oregon Street. The alternative would terminate with tail tracks within the Fauntleroy Way Southwest right-of-way just past Southwest Edmunds Street.

Alternative WSJ-2, when connecting to Alternative DEL-5 in the Delridge Segment, would have the most severe noise impacts of all the West Seattle Junction Segment alternatives.

The largest concentration of severe noise impacts would be at Fauntleroy Way Southwest near the end of the alignment at a four-story apartment building. One other severe noise impact would occur at a single-family residence at the intersection of Southwest Oregon Street and 38th Avenue Southwest, where the structure would be in close proximity to the guideway, have no acoustical shielding from the guideway, and would be within 300 feet of a double crossover just north of Alaska Junction Station.

When connecting to Alternative DEL-5, some moderate noise impacts would change to severe noise impacts at multi-story apartment buildings on Southwest Avalon Way between Southwest Genesee Street and 35th Avenue Southwest. It would also have more severe impacts when connecting to Alternative DEL-5 than it would connecting to Alternative DEL-1a.

Moderate noise impacts for this alternative would occur at single- and multi-family residences starting from the southwest corner of Southwest Genesee Street and Southwest Avalon Way and continue to 35th Avenue Southwest, affecting residences north and south of the guideway. Affected residences would be in close proximity to the guideway, have no acoustical shielding, or a combination of both. All residences with moderate noise impacts would be within 500 feet of Avalon Station. The largest concentration of moderate noise impacts is predicted for several multi-story apartment complexes south of Avalon Station.

At 36th Avenue Southwest and Southwest Genesee Street a small cluster of single- and multi-family residences would have moderate noise impacts due to close guideway proximity, no acoustical shielding, and being within 500 feet of Avalon Station. The double crossover between Avalon Station and Alaska Junction Station would be primarily responsible for the moderate noise impacts on 37th Avenue Southwest.

Another concentration of identified moderate noise impacts would be at two apartment buildings to the west of Alaska Junction Station on the corners of Southwest Alaska Street and Fauntleroy Way Southwest. Both buildings would have high receiver elevations and their uppermost floors would overlook or be at level with Alaska Junction Station. They also would be in close proximity to the guideway and would not have any acoustical shielding. To the east of Alaska Junction Station, all the mixed-use, multi-story residences on 38th Avenue Southwest between Fauntleroy Way Southwest and Southwest Alaska Street would have moderate noise impacts. These buildings would be near the guideway and have no acoustical shielding due in part to the high receiver elevations. The buildings would be within 500 feet of Alaska Junction Station or 300 feet of the double crossover and in some cases, both. The last cluster of moderate noise impacts would occur on both the east and west sides of Fauntleroy Way Southwest south of Southwest Edmunds Street.

With Alternative WSJ-2, two 625-foot-radius curves would be between Avalon Station and Alaska Junction Station. The first would be at the intersection of 36th Avenue Southwest and Fauntleroy Way Southwest where the guideway turns southwest and the second curve at the intersection of Fauntleroy Way Southwest and 38th Avenue Southwest as the guideway angles closer to south. A remaining curve, with a 750-foot radius, would be at Fauntleroy Way Southwest between Southwest Alaska Street and Southwest Edmunds Street after Alaska Junction Station and before the end of the light rail line.

There would be only one crossover within this alternative, on the elevated trackway along Fauntleroy Way Southwest at the intersection with Southwest Oregon Street. The crossover would contribute to noise impacts in this area.

Short Tunnel 41st Avenue Station Alternative (WSJ-4)

Alternative WSJ-4 could connect to Alternative DEL-1a, Option DEL-1b, Alternative DEL-3, or Alternative DEL-5. The alternative would travel along the south side of Southwest Genesee Street from 31st Avenue Southwest to the west side of Fauntleroy Way Southwest. It would continue along the west side of Fauntleroy Way Southwest on elevated guideway before transitioning to at-grade near 37th Avenue Southwest. It would then turn west near Southwest Oregon Street and transition into a tunnel with a portal in the vicinity of Southwest Oregon Street and 38th Avenue Southwest. The alternative would have fewer moderate noise impacts than Alternative WSJ-1 or Alternative WSJ-2 and no severe noise impacts.

The majority of moderate noise impacts would occur at residences near Avalon Station and would primarily affect multi-family residences along Southwest Avalon Way between 35th Avenue Southwest and Southwest Genesee Street. Other single- and multi-family residences that would have moderate impacts are around the intersection of Southwest Genesee Street and 32nd Avenue Southwest. West of Avalon Station, multi-family residences on the north side of Southwest Genesee Street between 36th Avenue Southwest and 37th Avenue Southwest would have moderate noise impacts because of their proximity to the guideway and no acoustical shielding.

Alternative WSJ-4 would only have two curves at a 1,250-foot radius or less. The first would be a 625-foot-radius curve at the intersection of Fauntleroy Way and Southwest Genesee Street after Avalon Station where the track turns southwest. The final curve would be within the cut-and-cover portion of the guideway just before entering the tunnel portal and therefore would not have an impact on surrounding residences.

Medium Tunnel 41st Avenue Station Alternative (WSJ-5a)

Alternative WSJ-5a would connect to Preferred Option DEL-6b and Alternative DEL-6a. Beginning in the Delridge Segment, the alternative begins in a retained cut south of Southwest Yancy Street and follows the east side of the West Seattle Bridge connection to Southwest Genesee Street in the West Seattle Junction Segment. The alignment enters a tunnel at Southwest Genesee Street and 37th Avenue Southwest. This alternative would have the least overall noise impacts for the above-grade alternatives and no severe noise impacts.

Moderate noise impacts are predicted along 32nd Avenue Southwest just north of the intersection with Southwest Genesee Street and at one residence on the south side of Southwest Genesee Street. The single-family residences would have moderate noise impacts due to the close proximity to the guideway and little to no acoustical shielding.

Alternative WSJ-5a would have a 675-foot-radius curve that would be shared with Alternative DEL-6a. It would be at the Delridge Segment/West Seattle Junction Segment boundary east of West Seattle Bridge/Fauntleroy Way. There are no Category 1 Land Uses in the West Seattle Junction Segment. There are no noise-sensitive parks in the West Seattle Junction Segment.

West Seattle Junction Segment Bus Operations

All buses serving the station alternatives in the West Seattle Junction Segment would be along existing roadways, including Southwest Avalon Way, 35th Avenue Southwest, Southwest Alaska Street, and Fauntleroy Way Southwest; therefore, no noise analysis for buses was required.

6.1.2 Traffic Noise Impact Analysis

This section provides an analysis of project-related areas considered for traffic noise impacts in the West Seattle Link Extension area. There are potential traffic revisions planned as part of the West Seattle Link Extension along with some removal of shielding that could result in increased traffic noise levels. As required by the FTA, if the transit project could result in traffic noise impacts, then the project must also evaluate the traffic noise and identify impacts and provide mitigation consistent with agency policy. In most locations, the slight modifications to traffic or removal of shielding are not predicted to cause a measurable change in traffic noise levels and no traffic noise analysis is required. Locations where increased traffic noise levels could cause new project-related traffic noise impacts are evaluated in the following sections.

6.1.2.1 No Build Alternative

Under the No Build Alternative, traffic noise levels would continue to be dominated by major and minor arterial roadways including traffic on the West Seattle Bridge. Other major roadways with high levels of traffic noise include 4th Avenue South and Alaskan Way in the SODO and Duwamish segments. Roadways with major contributions to noise in the Delridge Segment area include Delridge Way Southwest, Southwest Genesee Street, Southwest Avalon Way, Fauntleroy Way Southwest, and 35th Avenue Southwest. Major roadways in the West Seattle Junction Segment area include Fauntleroy Way Southwest and 35th Avenue Southwest in addition to Southwest Alaska Street, and California Avenue Southwest. These roadways would continue to be major noise sources in these areas.

6.1.2.2 Build Alternatives

Although there are some displacements and roadway modifications planned for the West Seattle Link Extension, most are not predicted to result in any new traffic noise impacts.

Within the Delridge Segment, under Preferred Option DEL-6b, Alternative DEL-7, and Alternative DEL-6a, several residences along the east side of 32nd Avenue Southwest could be exposed to noise from the West Seattle Bridge roadway due to the removal of existing residential structures on the west side of 32nd Avenue Southwest. A preliminary traffic noise analysis was performed for the residences that would lose acoustical shielding from Fauntleroy Way Southwest/West Seattle Bridge traffic noise. Based on the preliminary analysis, although noise levels would be expected to increase by 3 to 6 dB over existing conditions, due to the distance from the highway to the residences of over 240 feet, noise levels would remain well below the Federal Highway Administration impact criteria, and therefore no noise impacts were identified.

No other traffic noise related issues were identified for the West Seattle Link Extension.

6.2 Construction Noise Impacts

Construction noise was analyzed using the methodology established in the FTA Guidance Manual (2018) to document predicted noise impacts from the project's construction. This analysis was conducted for a variety of different construction activities that are anticipated to generate the highest sound levels, require nighttime construction, or are expected to require several months to complete.

An assessment of construction noise levels was performed with noise metrics that can be compared with the City of Seattle construction noise ordinance. The Seattle Municipal Code Chapter 25.08 was used for the criteria for construction noise level limits, along with noise allowances from the Seattle Noise Ordinance for construction activities.

The following activities are expected to produce the highest sound levels, would be done during nighttime hours, or require several months to complete:

- Elevated Light Rail Construction
- Retained-cut Construction
- Tunneling
- Cut-and-cover Station Construction
- Bridge Construction Over Water Crossings

Table 6-4 lists the types of construction equipment used in the analysis with representative sound levels established in the FTA Guidance Manual (2018), which are Leq sound levels 50 feet from the equipment. Construction sound levels were generally predicted using the methodology detailed in Section 7 of the FTA Guidance Manual (2018), which analyzes the two loudest pieces of equipment expected for a particular activity.

Computer noise models were used to predict sound levels at Category 1 land uses from nearby construction activities. The noise models accounted for the effects of distance, topography, and surface reflections on sound levels and used the reference sound levels provided in the FTA Guidance Manual (2018).

Table 6-4. Construction Equipment Sound Levels

Construction Equipment	Sound Level at 50 feet Leq (in dBA)
Air Compressor	80
Backhoe	80
Concrete Mixer	85
Concrete Pump	82
Crane	83
Excavator	81
Generator	82
Impact Pile Driver	101
Jackhammer	88
Loader	80
Pneumatic Tools	85
Roller	85
Truck	84

Source: FTA 2018.

Predicted sound levels from elevated light rail construction, retained-cut construction, tunneling, cut-and-cover station construction, and bridge construction over water crossings are listed in Table 6-5.

Table 6-5. Predicted Construction Sound Levels

Construction Activity	Construction Equipment	Sound Level at 50 feet Leq (dBA) [a]
Elevated Light Rail Construction	Cranes, excavators, concrete pumps, pneumatic tools	85 to 87
Retained-Cut Construction	Cranes, backhoes, jackhammers, excavators, pneumatic tools, concrete mixers	84 to 89
At-Grade Construction	Excavators, backhoes, concrete mixers, concrete pumps, haul trucks, loaders	86 to 87
Ground Improvements	Generators, air compressors, loaders, haul trucks, concrete mixers	80 to 87
Tunneling	Excavators, backhoes, haul trucks, loaders	84 to 86
Cut-and-Cover Station Construction	Excavators, backhoes, haul trucks, loaders, vibratory rollers	84 to 88
Bridge Construction Over Water Crossings	Cranes, pile drivers, concrete mixer, concrete pumps	87 to 101

Source: FTA 2018.

[a] The sound levels show the two loudest pieces of equipment operating at the same time.

6.2.1 Construction Noise Sources

6.2.1.1 Elevated Light Rail Construction

Alternatives that include construction of elevated light rail structures occur in the Duwamish, Delridge, and West Seattle Junction segments.

Demolition of existing structures and relocation of utilities would likely be required in several of these work areas before beginning heavy civil construction. Once heavy civil construction begins, construction activities may include the following:

- Footings and Drilled Shafts – Elevated guideway construction would likely begin with preparation work to construct foundations that may consist of shallow spread footings or drilled shafts. Excavators, cranes, haul trucks, concrete mixers, and concrete pump trucks would likely be used during this work.
- Concrete Guideway Columns and Piers – Following the foundations, concrete guideway columns and piers that support the guideway could be constructed. Equipment anticipated to be used during this work could include cranes, haul trucks, concrete mixers, and concrete pump trucks.
- Elevated Guideway and Falsework – The elevated guideway superstructure could be constructed of either cast-in-place or pre-cast reinforced concrete. Falsework would be required where cast-in-place construction is used to support the superstructure while the concrete is poured and cures. Loud equipment anticipated to be used could include cranes, air compressors, pneumatic tools, haul trucks, concrete mixers, and concrete pump trucks.
- Elevated Station Construction – Construction of the elevated stations would be similar to construction of the guideway but include construction of station platforms and include the use of the same general equipment used for the guideway construction, along with trucks for delivery of materials for station construction and finishing.

The loudest sources of noise would be from cranes and pneumatic tools. Sounds levels from elevated light rail construction may exceed 87 dBA at 50 feet from construction activities.

6.2.1.2 Retained-cut Construction

Alternatives with areas requiring retained-cut construction include the Duwamish, Delridge, and West Seattle Junction segments. Construction activities may include the following:

- Demolition of Existing Structures – Retained-cut construction may involve demolition of existing structures and clearing and grading. Existing structures would need to be removed before excavation. Demolition may include the use of cranes, backhoes, excavators, loaders, haul trucks, and jackhammers.
- Excavation – After any existing structures are removed, excavation activities could begin. Equipment used during excavation may include excavators, loaders, haul trucks, and backhoes.
- Construction of Guideways – Excavation may be necessary to construct the subgrade, track slabs, drainage structures, and below-grade light rail infrastructure. The work may include the use of cranes, air compressors, pneumatic tools, concrete mixers, and concrete pump trucks.
- Construction of Retaining Walls – In some locations, subsurface anchors, or tiebacks may be required to support the retaining walls. Dewatering may also be necessary in some locations. Retaining wall construction could include the use of cranes, haul trucks, concrete mixers, and concrete pump trucks.

The loudest sources of construction noise would be from jackhammers and other demolition equipment, as well as concrete mixers, cranes, and pneumatic tools. Sound levels from retained-cut construction could be over 89 dBA at 50 feet from construction activities.

6.2.1.3 At-Grade Construction

At-grade construction is anticipated to occur primarily within the SODO Segment. Preferred Option SODO-1c, Alternative SODO-1a, and Option SODO-1b include construction of the at-grade SODO Station. Construction activities may include the following:

- Shallow Excavations – Construction of at-grade guideways would be similar to typical road construction and would involve shallow excavations to construct the subgrade, track, and station platform slabs. Equipment used during this process may include haul trucks, loaders, excavators, and backhoes.
- Concrete Pours – After excavation concrete would be poured to form the station platform slabs and may include concrete mixers, and concrete pumps.

The loudest noise sources would be concrete mixers and haul trucks. Sound levels from at-grade construction could be over 87 dBA at 50 feet from construction activities.

6.2.1.4 Ground Improvements

Ground improvements may be needed to address weak soils in order to build on them and may be needed throughout the project corridor. Ground improvements may be necessary in the Duwamish and SODO segments, which are predominantly fill material on top of tide flats.

Ground improvements may include jet grouting, ground freezing, rock displacement, or a combination of these methods. Construction equipment may include generators, air compressors, loaders, haul trucks, and concrete mixers. Construction noise from ground improvements could be over 87 dBA at 50 feet from the construction activities. The loudest sound sources would be concrete mixers and haul trucks.

6.2.1.5 Tunneling

Alternatives with areas requiring mined tunnel construction would include the Delridge and West Seattle Junction segments. Although tunneling may occur under several noise-sensitive properties throughout the project corridor, above-grade construction, which would be concentrated near the tunnel portals and underground station locations are the primary locations for potential construction noise impacts. Construction activities near the tunnel portals may include the following:

- Portal and Shaft Excavation – Tunnel construction requires tunnel portals at the beginning and end of each tunnel for launch and retrieval of equipment. On hillsides, portals may be dug directly into the hillside, while in flatter areas, an access shaft or pit would be excavated from the surface. Soil stabilization would be necessary to support excavation of access shafts or pits. At several locations these pits would also serve as below-grade stations after tunneling has been completed. Construction of portals or shafts would likely require the use of excavators, haul trucks, and backhoes.
- Transporting Spoils – Once tunneling is underway, spoils would be transported back to the tunnel portals and hauled off the site. Spoils would likely be loaded into trucks, or depending on the portal location, by barge or train for removal from the site. Transporting spoils would likely require material conveyors, haul trucks, and loaders. Ventilation fans would also run continuously to supply fresh air to construction crews working inside the tunnel.

The loudest construction sound sources would be excavators, haul trucks and ventilation fans to provide fresh air inside the tunnel. Sound levels near the tunnel portals may be over 86 dBA at 50 feet from construction activities.

6.2.1.6 Cut-and-Cover Construction

Cut-and-cover construction would be used for below-grade station construction for the Alaska Junction Station and tail track in the West Seattle Junction Segment. Construction activities during cut-and-cover work may include the following:

- Excavation – Cut-and-cover construction involves excavating from the surface, similar to retained-cut construction. Excavation may include the use of excavators, haul trucks, and backhoes.
- Transporting Spoils – As excavation is underway the excavated materials would likely need to be removed from the site. Removal of excavated materials would likely require the use of haul trucks, and loaders.
- Backfill – Cut-and-cover construction also requires backfilling with imported fill or suitable excavated material after construction of the lid or station roof. This may require the use of excavators, backhoes, haul trucks, and vibratory rollers.
- Roadway Repair – Roadways that are removed and replaced as part of the project may need to be reconstructed. Roadway repairs may occur throughout the project area. Equipment would include pavers, backhoes, haul trucks, and vibratory rollers.

The loudest sources of noise would include haul trucks and vibratory rollers. Sound levels may be over 88 dBA at 50 feet from construction activities.

6.2.1.7 Bridge Construction over the Duwamish Waterway

Alternatives in the Duwamish Segment may include the following construction activities for crossing the Duwamish Waterway:

- Construct Temporary Work Trestles, Piles and Install Cofferdams – Temporary work trestles may need to be constructed to support material deliveries and operation of heavy equipment. Construction of temporary work trestles would be accomplished by driving or vibrating steel-pipe piles into the ground and constructing bents, framing, and decking. Temporary piles and sheet piles for cofferdam walls would be driven or vibrated into place, and the bridge support columns would be installed within the dewatered cofferdams. Temporary work trestle and cofferdam construction may require impact and/or vibratory pile drivers, delivery trucks, and cranes.
- Construct Bridge Segments – Bridge superstructures would follow construction of the bridge foundations. Cranes, concrete pump trucks, and mixers would likely be used during construction of the bridge segments.

The loudest type of construction equipment would be pile drivers. During pile installation sound levels may exceed 101 dBA at 50 feet from pile-driving. Other construction activities would likely be 87 dBA at 50 feet.

6.2.2 No Build Alternative

Under the No Build Alternative, construction would not take place and no impacts from construction noise would occur.

6.2.3 Build Alternatives

Residential neighborhoods are near the west end of the Duwamish Segment and throughout the Delridge Segment and the West Seattle Junction Segment. Noise impacts from construction activities are most likely to occur at residential properties within these segments. The SODO and Duwamish segments are mostly comprised of industrial and commercial properties.

6.2.3.1 SODO Segment

The SODO Segment is between South Forest Street and South Holgate Street and is within an industrial district. The closest residential properties are nearly 0.5 mile away and east of Interstate 5. Therefore, no construction noise impacts are expected.

6.2.3.2 Duwamish Segment

Properties within the Duwamish Segment are primarily industrial. There is a residential district west of West Marginal Way Southwest and south of the West Seattle Bridge in Pigeon Point. Secret Studio Records/Studio 1208 is the only FTA Category 1 land use for noise in the Duwamish Segment. The Bootstrap Music Company is also in this segment but is located near major heavy trucking routes and freight train tracks and therefore is not considered noise-sensitive.

All three Duwamish Segment Build Alternatives would include construction of elevated guideway from the SODO Segment and a bridge over the Duwamish Waterway. Preferred Alternative DUW-1a and Option DUW-1b would cross the Duwamish Waterway on a new bridge south of the West Seattle Bridge and transition into a retained cut at the north side of Pigeon Point before connecting to the Delridge Segment. Alternative DUW-2 would construct a new bridge to the north of the West Seattle Bridge and remain elevated until connecting to the Delridge Segment.

The closest residential properties are approximately 100 feet from Preferred Alternative DUW-1a and Option DUW-1b. These properties would be near the transition from elevated structures to retained cut and would experience construction noise from both types of construction. Sound levels from elevated construction are expected to be up to 81 dBA and up to 83 dBA during retained-cut construction. These activities are expected to exceed the city's construction noise limits and result in noise impacts at nearby residential properties around Pigeon Point.

Because of the proximity of construction activities, the Bootstrap Music Company could experience sound levels exceeding 92 dBA during construction of the elevated guideway under Preferred Alternative DUW-1a and Option DUW-1b. Although sound levels are not expected to exceed City of Seattle construction noise limits, construction noise may temporally affect operations within the Bootstrap Music Company during periods of heavy construction. Under Alternative DUW-2, the Bootstrap Music Company could experience construction noise up to 66 dBA during the construction of the elevated guideway, which is unlikely to impact its operations given the existing noise environment.

Although Secret Studio Records/Studio 1208 on the southwest corner of 23rd Avenue Southwest and Southwest Andover Street is located in the Duwamish Segment, construction noise at this FTA Category 1 receiver would come from project construction in the Delridge Segment and is discussed in Section 6.2.3.3.

Alternative DUW-2 is approximately 500 feet from residential properties and does not require retained-cut construction. Because Alternative DUW-2 is farther from residential properties than the other alternatives, it is expected to result in the least noise impacts.

Bridge construction would likely take place in industrial districts on the shore of the Duwamish Waterway and Harbor Island, or in the water. The loudest sound levels would likely be generated from pile-driving during construction of the temporary work trestle, piles, and cofferdams. Sound levels during pile-driving are expected to exceed 101 dBA at 50 feet from the work. Nearby noise-sensitive properties may experience sound levels up to 78 dBA during pile-driving. Construction of the bridge may take 3 to 4 years to complete.

Nighttime construction may be required at locations along the elevated guideway where it crosses over roadways, such as the West Seattle Bridge and West Marginal Way Southwest. A noise variance for any nighttime work would be requested from the City of Seattle.

6.2.3.3 Delridge Segment

The Delridge Segment is mostly made up of residential districts. Industrial districts are north of Southwest Andover Street and a commercial district is between Southwest Andover Street and residences south of Southwest Yancy Street. As previously described, although Secret Studio Records/Studio 1208 is in the Duwamish Segment, due to its location and nearby hills, it would experience higher levels of construction noise from construction occurring within the Delridge Segment than the Duwamish Segment.

All of the Delridge Segment alternatives would include elevated guideway between the Duwamish Segment and the station. The location of the station varies between alternatives and could be north of Southwest Andover Street to the west of Delridge Way Southwest, on Delridge Way Southwest between Southwest Andover Street and Southwest Dakota Street, or between Southwest Dakota Street and Southwest Genesee Street. Nighttime construction could be necessary in areas crossing over roadways, requiring a noise variance.

West of the station the light rail would remain elevated to the West Seattle Junction Segment under Alternative DEL-1a, Option DEL-1b, Alternative DEL-3, and Alternative DEL-5. The alignment would enter a retained cut for Preferred Option DEL-6b and Alternative DEL-6a near 32nd Avenue Southwest. Alternative DEL-2a and Alternative DEL-4 would transition to a short section of retained cut near 30th Avenue Southwest.

All alternatives would require guideway construction within 50 feet of residential properties. This may result in sound levels of up to 87 dBA and would likely exceed Seattle construction sound limits.

City of Seattle construction noise limits would likely be met at Secret Studio Records/Studio 1208 under all alternatives. Construction of Preferred Option DEL-6b, Alternative DEL-5, Alternative DEL-6a, and Alternative DEL-7 are expected to generate noise levels up to 70 dBA at Secret Studio Records/Studio 1208. This is lower than the other alternatives that are along Delridge Way, which are expected to generate noise levels up to 75 dBA. Because the distances between Secret Studio Records/Studio 1208 and the Delridge Station under Preferred Option DEL-6b and Alternatives DEL-3, DEL-4, DEL-5, DEL-6a, and DEL-7 are similar, construction of the station is expected to result in similar construction noise levels at Secret Studio Records/Studio 1208 and would be approximately 67 dBA. Station construction under Alternative DEL-1a, Option DEL-1b, Alternative DEL-2a, and Option DEL-2b would be further away from Secret Studio Records/Studio 1208 and would likely result in sound levels of approximately 60 dBA.

Tunnel construction would occur under Alternative DEL-2a, Alternative DEL-4, and Alternative DEL-7. Tunnel portals under Alternative DEL-2a and Alternative DEL-4 would be constructed at Southwest Genesee Street near 30th Avenue Southwest and may take up to 2 years to build. The tunnel portal under Alternative DEL-7 would be constructed near Southwest Andover Street. Tunneling would typically occur 20 to 24 hours per day, 6 to 7 days per week. Nighttime construction may include removing spoils from the site and delivering materials.

Ventilation fans could be necessary to supply fresh air to construction crews working inside the tunnel and would likely operate continuously. Tunnel construction may last for 1 to 2 years.

Tunnel portals constructed under all alternatives would be within residential districts and the closest residential properties would be approximately 50 feet away from construction activities. Sound levels at these properties may by up to 86 dBA and exceed the City's construction sound limits and result in noise impacts.

Construction of Preferred Option DEL-6b, Alternative DEL-5, and Alternative DEL-6a may result in the least noise impacts at residential properties because a portion of the alignment would be within industrial and commercial districts and farther away from noise-sensitive properties than other alternatives. Although most of Alternative DEL-7 would also be within industrial and commercial properties and would include a tunnel, construction at the tunnel portal would be within a residential district, likely include night work, and have a longer construction duration than Preferred Option DEL-6b, Alternative DEL-5, and Alternative DEL-6a.

6.2.3.4 West Seattle Junction Segment

The West Seattle Junction Segment includes residential and commercial districts. Residential properties are throughout the segment and commercial properties are generally between Southwest Alaska Street and Southwest Edmunds Street.

Elevated guideway construction would be necessary to construct the Alternative WSJ-1, Alternative WSJ-2, and northern portion of Alternative WSJ-4. The Avalon Station would be elevated under these three alternatives. Nighttime construction may be required when crossing over roadways. The elevated guideway and the construction of Avalon Station may take 2 to 3 years to complete.

Properties within residential districts would be within 50 feet of elevated construction. These properties would likely experience construction sound levels of up to 87 dBA which exceeds Seattle construction noise limits and would result in noise impacts.

Some West Seattle Junction alternatives would include construction of a tunnel and underground Alaska Junction Station. Construction of the underground station would use cut-and-cover construction and take 4 to 6 years to build.

Because the tunnels in the West Seattle Junction Segment are relatively short and shallow, the tunnel could be built using a tunnel boring machine or sequential excavation mining. Both tunneling methods would require ventilation fans on the surface to supply fresh air into the tunnel and would run continuously. Nighttime work would likely be necessary to remove spoils from the portal area. Tunneling may take 1 to 2 years to construct.

The tunnel options with tunnel portals close to or within residential districts in the West Seattle Junction Segment would be Preferred Option WSJ-5b, Alternative WSJ-4, and Alternative WSJ-5a. Residential properties would be approximately 50 feet from the tunnel portals and may experience sound levels up to 86 dBA. These sound levels would exceed the city's construction sound limits and would result in noise impacts.

Alternative WSJ-1 and Alternative WSJ-2 may result in less impacts at noise-sensitive properties than other alternatives which require tunneling. Although tunneling would take place underground, night work at the tunnel portals may last several years, whereas elevated construction may only require night work when crossing over roadways and the overall construction duration may be less than construction of a below-grade station and tunnel.

6.3 Operational Vibration Impacts

This section presents the results of the detailed assessment of vibration impacts from train operations. The assessment was based on the FTA methodology discussed in Section 4.2, Vibration Assumptions and Methods. The inputs for the assessment include distance from the receivers to the tracks, train speeds, track type, and other relevant information such as proximity to special trackwork.

6.3.1 No Build Alternative

The No Build Alternative would not result in any change to the existing vibration environment. There are no projected vibration impacts for the No Build Alternative.

6.3.2 Build Alternatives

Tables 6-6 through 6-8 and Figures 6-4 through 6-6 summarize the number of groundborne noise and vibration impacts by alternative for segments where impacts were predicted. A discussion of key differences between alternatives follows. Attachment N.3E includes detailed maps that show the locations of sensitive receivers with projected impact and Attachment N.3G contains tables with the projected vibration and groundborne noise levels for all sensitive receivers.

6.3.2.1 SODO Segment

Based on the land use review, there were no FTA vibration-sensitive properties in the SODO Segment; therefore, no vibration impacts were identified.

6.3.2.2 Duwamish Segment

Vibration impacts are shown in Table 6-6 and on Figure 6-4. Groundborne noise impacts were not assessed for elevated alternatives. Preferred Alternative DUW-1a is the only alternative with projected impacts in the Duwamish Segment, and the projected impacts are near crossovers. Crossovers are special trackwork that can increase predicted vibration levels by 5 to 10 decibels. An impact is projected at Fire Station 14 near the turnout at the entrance to the Operations and Maintenance Facility Central. When connecting to Preferred Option DEL-6b or Alternative DEL-7, an impact is also projected at a single-family residence near the crossover east of Delridge Way Southwest near the West Seattle Bridge on-ramp. When connecting to Alternative DEL-5 or Alternative DEL-6a, the crossover located near Delridge Way Southwest is further from sensitive receivers and no impact is projected at that crossover location.

Alternative DUW-1b and Alternative DUW-2 in the Duwamish Segment are not projected to have impacts, because they do not have special trackwork as close to sensitive receivers. All alternatives and options in this segment would be mostly elevated, which reduces vibration levels by about 10 dB compared with at-grade track. Therefore, there are few impacts in this segment compared to the West Seattle Junction and Delridge segments.

Alternative DUW-2 is near Harbor Island Machine Works, a precision manufacturing company with vibration-sensitive equipment, but the projected vibration level from light rail operations would not exceed the applicable limit.

Table 6-6. Summary of Vibration Impacts by Alternative in the Duwamish Segment

Alternatives and Design Options	Category 1 Vibration Impacts	Category 2 Vibration Impacts	Category 3 Vibration Impacts	Total Vibration Impacts	Distance Range (feet) [a]	Range of exceedance (dB) [b]
Preferred South Crossing Alternative (DUW-1a)	**0**	**1 to 2**	**0**	**1 to 2**	**67 to 172**	**0 to 1**
South Crossing South Edge Crossing Alignment Option (DUW-1b)	0	0	0	0	Not applicable	Not applicable
North Crossing Alternative (DUW-2)	0	0	0	0	Not applicable	Not applicable

Note: Numbers presented are individual residences (including units at multi-family structures) for FTA Category 2 land uses and number of structures for FTA Category 1 and 3 land uses.

[a] The slant distance between the near track and the façade of the sensitive receivers with impact, in feet. For alternatives with no impact, no distance is provided.

[b] The decibel amount by which the vibration (VdB) or groundborne noise (dBA) would exceed the applicable criteria. For alternatives with no impact, no value is provided.

6.3.2.3 Delridge Segment

Vibration and groundborne noise impacts are shown in Table 6-7 and on Figure 6-5. Groundborne noise impacts were not assessed for elevated alternatives. Preferred Option DEL-6b would have impacts at one single-family residence near the intersection of Southwest Andover Street and Southwest Avalon Way.

Alternative DEL-1 and Alternative DEL-3 would have the most impacts in the Delridge Segment. The impacts would be at the same multi-family building, the Golden Tee Apartments, near the intersection of Southwest Genesee Street and Southwest Avalon Way.

Option DEL-1b, Alternative DEL-2a, Option DEL-2b, and Alternative DEL-4 would not have any impacts. The sensitive receivers closest to these options would be displaced as part of the project and the projected vibration levels at the nearest remaining sensitive receivers would be below the criteria.

For Alternative DEL-5 and Alternative DEL-6a, there would be impacts at the residences closest to the alignment. Alternative DEL-6a would impact several single-family residences. Alternative DEL-5 would impact a multi-family building at 30th Avenue Southwest and Southwest Dakota Street that has a greater number of dwelling units and therefore would have more impacts.

For Alternative DEL-7, there would be groundborne noise impacts at the residences near the tunnel portal. All of the impacts for Alternative DEL-7 would be at single-family residences.

Table 6-7. Summary of Vibration Impacts by Alternative in the Delridge Segment

Alternatives and Design Options	Category 1 Vibration Impacts	Category 2 Vibration Impacts	Category 2 Groundborne Noise Impacts	Category 3 Vibration Impacts	Total Vibration or Groundborne Noise Impacts	Distance Range (feet) [a]	Range of Exceedance (dB) [b]
Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)	**0**	**1**	**Not applicable**	**0**	**1**	**26**	**1**
Dakota Street Station Alternative (DEL-1a)	0	12	Not applicable	0	12	44	<1
Dakota Street Station North Alignment Option (DEL-1b)	0	0	Not applicable	0	0	Not applicable	Not applicable
Dakota Street Station Lower Height Alternative (DEL-2a)	0	0	Not applicable	0	0	Not applicable	Not applicable
Dakota Street Station Lower Height North Alignment Option (DEL-2b)	0	0	Not applicable	0	0	Not applicable	Not applicable
Delridge Way Station Alternative (DEL-3)	0	12	Not applicable	0	12	42	<1
Delridge Way Station Lower Height Alternative (DEL-4)	0	0	Not applicable	0	0	Not applicable	Not applicable
Andover Street Station Alternative (DEL-5)	0	9	Not applicable	0	9	27	<1
Andover Street Station Lower Height Alternative (DEL-6a)	0	3	Not applicable	0	3	50 to 76	1 to 4
Andover Street Station Lower Height No Avalon Station Tunnel Connection Alternative (DEL-7)	0	0	9	0	9	54 to 124	0 to 8

Note: Numbers presented are individual residences (including units at multi-family structures) for FTA Category 2 land uses and number of structures for FTA Category 1 and 3 land uses.

[a] The slant distance between the near track and the façade of the sensitive receivers with impact, in feet. For alternatives with no impact, no distance is provided.

[b] The decibel amount by which the vibration (VdB) or groundborne noise (dBA) would exceed the applicable criteria. For alternatives with no impact, no value is provided.

6.3.2.4 West Seattle Junction Segment

Groundborne noise and vibration impacts are shown in Table 6-8 and on Figure 6-6. In the West Seattle Junction Segment, the tunnel alternatives would have more impacts than the elevated alternatives because the elevated structures would reduce vibration levels by about 10 dB. All of the impacts for the tunnel alternatives would be from groundborne noise.

Preferred Option WSJ-5 would have impacts near the crossover south of Alaska Junction Station and where the tunnel is shallowest near the tunnel portal and along the curve.

Option WSJ-3b would have the most impacts, which would be concentrated in multi-family buildings along 42nd Avenue Southwest near Southwest Alaska Street and east of Avalon Station along Southwest Avalon Way. Alternative WSJ-2 would have no impacts because of the vibration reduction provided by the elevated structure.

Alternative WSJ-1 would have impacts near a crossover north of the Alaska Junction Station but would have a low number of impacts overall because of the low density of residences near the crossover and the vibration reduction provided by the elevated structure.

For Alternative WSJ-3a, groundborne noise impacts would occur where the tunnel becomes shallower east of the Avalon Station and near the crossover south of the Alaska Junction Station. Alternative WSJ-3a would have impacts at fewer residential dwelling units when connecting to Option DEL-2b compared to connecting with Alternative DEL-2a because the tunnel would be deeper when connecting to Option DEL-2b.

Option WSJ-3b would have the most impacts, but the projected impacts are concentrated in a few multi-family buildings east of the Avalon Station and south of the Alaska Junction Station near a crossover. Option WSJ-3b would have impacts at fewer residential dwelling units when connecting to Option DEL-2b compared to connecting with Alternative DEL-2a because the tunnel would be deeper when connecting to Option DEL-2b.

Alternative WSJ-5a would have a lower number of impacts compared to Alternative WSJ-4 and Alternative WSJ-6. All three alternatives would have impacts at the residences near crossover locations and where the tunnel is shallowest. There are differences in the displacements required for construction of the Alaska Junction Station between the alternatives that affect large multi-family buildings and results in differences in the number of vibration or groundborne noise impacts. There are also differences in where the alternatives are shallowest as they approach different portal locations.

Table 6-8. Summary of Groundborne Noise and Vibration Impacts by Alternative in the West Seattle Junction Segment

Alternatives and Design Options	Category 1 Vibration or Groundborne Noise Impacts	Category 2 Vibration Impacts	Category 2 Groundborne Noise Impacts	Category 3 Vibration or Groundborne Noise Impacts	Total Vibration or Groundborne Noise Impacts	Distance Range (feet) [a]	Range of Exceedance (dB) [b]
Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)	**0**	**0**	**158**	**0**	**158**	**57 to 106**	**0 to 8**
Elevated 41st/42nd Avenue Station (WSJ-1)	0	7	Not applicable [c]	0	7	120 to 186	1 to 2
Elevated Fauntleroy Way Station (WSJ-2)	0	0	Not applicable [c]	0	0	Not applicable	Not applicable
Tunnel 41st Avenue Station (WSJ-3a)	0	0	24 to 199	0	24 to 199	64 to 130	0 to 6
Tunnel 42nd Avenue Station Option (WSJ-3b)	0	0	269 to 430	0	269 to 430	64 to 95	0 to 7
Short Tunnel 41st Avenue Station (WSJ-4)	0	0	153	0	153	55 to 106	0 to 10
Medium Tunnel 41st Avenue Station (WSJ-5a)	0	0	79	0	79	57 to 106	0 to 5
No Avalon Station Tunnel (WSJ-6)	0	0	144	0	144	81 to 106	0 to 6

Notes:

Numbers presented are individual residences (including units at multi-family structures) for FTA Category 2 land uses and number of structures for FTA Category 1 and 3 land uses.

Ranges reflect differences from connecting to different alternatives in adjacent segments.

[a] The slant distance between the near track and the façade of the sensitive receivers with impact, in feet. For alternatives with no impact, no distance is provided.

[b] The decibel amount by which the vibration (VdB) or groundborne noise (dBA) would exceed the applicable criteria. For alternatives with no impact, no distance is provided.

[c] Groundborne noise is not assessed for elevated alternatives.

6.4 Construction Vibration Impacts

As discussed in Section 4.2.2, Construction Vibration Prediction Methods, construction vibration generally falls into the categories of tunneling activities and surface construction activities. The vibration from tunneling muck and support trains are compared to the FTA criteria for operations because this can be a relatively long-term activity. For surface construction activities that are temporary in nature, the construction vibration criteria from Section 3.2.3, Construction Vibration Criteria, are applied. The construction vibration criteria were developed to avoid potential damage risk to buildings, while the operational vibration criteria were developed to avoid annoyance for Category 2 and Category 3 sensitive receivers. The construction vibration criteria are the thresholds for the potential of superficial damage, such as cracks in plaster, and are not the threshold at which structural damage would occur.

Category 1 and special-use buildings are evaluated using the FTA criteria for operations for all construction activities, because exceedances of those limits may interfere with operations inside the building. The construction vibration criteria also apply to historic buildings, which may be particularly susceptible to construction damage. Construction vibration impacts specific to historic buildings were not assessed. Historic buildings should be taken into account when updating the construction vibration assessment during final design when more information on construction means and methods is known.

6.4.1 Tunneling Vibration Impacts

The three major sources of vibration from tunneling are the cutterhead operation, thrust jack retraction during concrete liner installation, and operation of the supply train. The range of vibration levels expected from the three activities and the relevant criteria are shown on Figures 4-7 to 4-9. As shown in the figures, the range of expected levels for all three activities would be below the operational criteria for annoyance for Category 2 (residential) land uses, and therefore would also be below the criteria for institutional land uses, which have a higher limit.

There are no Category 1 or special-use buildings near tunnel alternatives in the West Seattle Link Extension study area. The expected vibration levels from tunneling would be below the operational criteria for annoyance for Category 2 (residential) and Category 3 (institutional) land uses. Therefore, there would be no vibration impact from tunneling in the West Seattle Link Extension study area. The predicted levels from tunneling activities relative to the Category 2 and Category 3 limits are shown on Figures 4-7 through 4-9. The predicted levels from tunneling operations are also below the most restrictive criteria for minor cosmetic building damage.

Groundborne noise has been evaluated for tunneling operations because there is no airborne noise path. Thresholds for groundborne noise due to train operations have been applied as the annoyance thresholds for tunneling activities. The thresholds are 35 dBA and 40 dBA for Category 2 and Category 3 land uses, respectively. Table 6-9 shows the range of expected groundborne noise levels based on data measured under the University of Washington campus presented in Section 4.2.2, Construction Vibration Prediction Methods, which show very high variability. Vibration from the tunnel boring machine cutterhead may reach as high as 40 dBA, which would exceed the criteria for Category 2 land uses and equal the criteria for Category 3 land uses. The highest groundborne noise levels are typically caused by very localized underground features such as cobbles, so it is not possible to identify precise locations where the groundborne noise criteria are most likely to be exceeded. Effects from the cutterhead would likely only last up to 1 week as the cutterhead makes progress along the tunnel.

Mitigation measures are discussed in Section 7.4, Construction Vibration Mitigation.

Table 6-9. Range of Predicted Groundborne Noise Levels During Tunneling

Vibration Source	Groundborne Noise Prediction (dBA) [a]
Tunnel Boring Machine Cutterhead	14 to 40
Thrust Jack Retraction	13 to 29
Supply Train with steel wheels and jointed rails	24 to 28

[a] Range is based on measured data from 0 to 200 feet from tunnel.

6.4.2 Surface Construction Vibration Impacts

The primary concern from construction activities is the potential for damage to buildings. Because the details of the construction means and methods for this project may change from what is described in Chapter 2, Alternatives Evaluated, of the Final EIS and there are several alternatives, the construction vibration analysis focused on determining the distance beyond which the damage risk criteria and annoyance criteria would not be exceeded.

Table 6-10 shows the distance at which vibration from different pieces of construction equipment is expected to be equal to different thresholds for potential damage, rounded up to the nearest 10 feet. The highest vibration-generating construction activity that could occur would be pile-driving. Several receivers have the potential to be impacted by pile-driving in areas where bridge construction, elevated track guideway, or retained cut guideway is planned.

Table 6-10. Distance to Vibration Thresholds for Construction Equipment Pieces

Equipment	Peak Particle Velocity Reference Level at 25 feet (inch per second)	Distance to 0.5 inch per second Damage Criteria (feet) [a]	Distance to 0.2 inch per second Damage Criteria (feet) [a]	Distance to Category 3 Annoyance Criteria (feet) [b]	Distance to Category 2 Annoyance Criteria (feet) [b]
Impact Pile Driver [c]	0.644 to 1.518	30 to 60	60 to 100	240 to 420	300 to 530
Sonic Pile Driver [c]	0.17 to 0.734	20 to 40	30 to 60	100 to 260	130 to 330
Hoe Ram	0.089	10	20	70	80
Large Bulldozer	0.089	10	20	70	80
Caisson Drilling	0.089	10	20	70	80
Loaded Trucks	0.076	10	20	60	80
Jackhammer	0.035	10	10	40	50
Small Bulldozer	0.003	10	5	10	10

[a] Thresholds defined in Section 3.2.2, Groundborne Noise Criteria: 0.5 inch per second for reinforced concrete, steel, or timber and 0.2 inch per second for nonengineered timber and masonry buildings.

[b] Annoyance limits of 75 VdB for Category 3, and 72 VdB for Category 2 on projects with frequent events (>70 per day).

[c] Reference levels and distances cover a range from typical to high amounts of vibration from the equipment.

The project may use impact or sonic (vibratory) pile-driving for the construction of elevated guideways, retained cut guideways, and the bridge over the Duwamish Waterway. Pile-driving would result in a risk of damage to nonengineered timber and masonry buildings (0.2 inch per second threshold) at structures within 100 feet of impact pile-driving and within 60 feet of sonic pile-driving. When structures are within these distances, pile-driving should be avoided in favor of alternative construction methods such as drilled shaft foundations or shallow spread footings.

Within the SODO Segment, there may be structures located within 100 feet of pile locations for the elevated alternative (Alternative SODO-2). There may be structures within 100 feet of pile locations for the retained cut sections north of South Walker Street for Preferred Option SODO-1c, Alternative SODO-1a, and Option SODO-1b.

Within the Duwamish Segment, pile-driving may be used for the new light rail bridge over the Duwamish Waterway, elevated guideways, and the retained cut section along the Pigeon Point neighborhood. For Preferred Alternative DUW-1a and Option DUW-1b, single-family residences in the Pigeon Point and Riverside neighborhoods west of the waterway may be within 100 feet of pile locations. For Preferred Alternative DUW-1a, some of the Harbor Marina buildings on Harbor Island may be within 100 feet of pile locations. For Option DUW-1b, there are unlikely to be any buildings within 100 feet of pile locations on Harbor Island. For Alternative DUW-2, the Harbor Island Machine Works and Meltec buildings on Harbor Island are likely to be within 100 feet of pile locations.

Within the Delridge Segment, pile-driving may be used for the elevated guideway for all alternatives and for retained cut sections near tunnel portals for some alternatives. For Alternative DEL-1a, Option DEL-1b, Alternative DEL-2a, Option DEL-2b, Alternative DEL-3, and Alternative DEL-4, the closest buildings to the guideway along Southwest Genesee Street and Delridge Way Southwest may be within 100 feet of pile locations for elevated structures. For Preferred Option DEL-6b, Alternative DEL-6a, and Alternative DEL-7, the closest structures along Southwest Yancy Street may be within 100 feet of the pile locations for elevated structures. For Alternative DEL-2a, Option DEL-2b, and Alternative DEL-4, the closest buildings to the retained cut near the tunnel portal locations east of Avalon Way Southwest may be within 100 feet of pile locations. For Preferred Option DEL-6b and Alternative DEL-6a, the closest residences to the retained cut section between the West Seattle Bridge and 32nd Avenue Southwest may be within 100 feet of pile locations.

Within the West Seattle Junction Segment, pile-driving may be used for the elevated guideway for Alternative WSJ-1 or Alternative WSJ-2. For both alternatives, there may be buildings within 100 feet of the pile locations near Fauntleroy Way Southwest; for Alternative WSJ-1, there may also be buildings within 100 feet of the pile locations near 42nd Avenue Southwest. Pile-driving may also be used for retained cut sections near the tunnel portals for Preferred Option WSJ-5b, Alternative WSJ-4, and Alternative WSJ-5a.

The results in Table 6-10 show that equipment other than pile drivers can operate without risk of damage at distances of 10 feet or greater from reinforced concrete buildings (0.5 inch per second threshold) and 20 feet or greater from nonengineered timber and masonry buildings (0.2 inch per second threshold), which are the most common types of buildings in the study area. The mitigation measures discussed in Section 7.4.1 should be considered when operating equipment within the damage criteria distances listed in Table 6-10. Plans to operate within these minimum distances should be avoided, as practical, when developing construction means and methods.

During final design, a construction vibration impact assessment would be developed to address all Category 1 receivers and locations where operations may be within these minimum distances and consider use of the vibration-reducing measures discussed in Section 7.4. Category 1 receivers, where high levels of vibration may disrupt business operations, are Harbor Island Machine Works and Secret Studio Records. In the Duwamish Segment, the Harbor Island Machine Works on Harbor Island is likely to be within 100 feet of pile locations for Alternative DUW-2. The Bootstrap Music Company, a music rehearsal space, is located near the east end of the West Seattle Bridge in the Duwamish Segment and is likely to be within 100 feet of pile locations for Preferred Alternative DUW-1a. The Bootstrap Music Company is

not considered a Category 1 land use because it is compatible with noise and vibration levels generated by operational light rail; however, higher levels of vibration and groundborne noise generated by construction might be noticeable in the building. In the Delridge Segment, the Secret Studio Records/Studio 1208 recording studio is likely to be within 300 feet of pile locations for Alternative DEL-1a, Option DEL-1b, Alternative DEL-2a, Option DEL-2b, Alternative DEL-3, and Alternative DEL-4, which is within a distance that vibration or groundborne noise generated by pile-driving may affect the operations of a recording studio.

6.5 Indirect Impacts

Indirect noise and vibration impacts include increased noise and/or vibration levels near the project that could be associated with transit-oriented development, typically traffic and construction noise and vibration. Although noise associated with future development could increase noise in the project corridor, any increase would be expected to be minimal and any new developments would be required to meet the City of Seattle noise regulations. Most vehicle traffic and other sources of environmental vibration are below the levels of human perception and would not constitute an indirect impact.

6.6 Cumulative Impacts

6.6.1 Operation

The FTA's methodology for noise and vibration analysis reflects both cumulative ambient noise conditions from land uses and activities from past and present activities in combination with project-specific noise and vibration impacts. All project noise impacts could be mitigated depending on the alternatives chosen. Most vibration impacts can also be mitigated; however, there could be residual vibration impacts in some segments.

The light rail vibration might occur concurrently with vibration from heavy trucks on rough roads and local construction activities. Cumulative vibration levels in most areas are not expected to differ from existing vibration levels. Exceptions to this would include areas that have extremely rough roadways with potholes or cracks, which would increase vibration levels from passing trucks and other heavy vehicles, and areas near active construction sites where equipment could cause short-term increases in vibration levels.

No other reasonably foreseeable future actions are expected to cause notable vibration impacts during project operation, so cumulative vibration impacts are not expected. Although Sound Transit is committed to mitigating project noise impacts, light rail would still create a new noise source and, therefore, would contribute to cumulative noise in the project corridor. In addition, the indirect impact of the project, combined with local land use policies, could attract more development around rail stations, which might result in more intense urban activities in some station areas, therefore adding cumulative noise to the surroundings.

6.6.2 Construction

During construction, the project would contribute noise and vibration impacts along with other nearby transportation and private development construction projects, and cumulative impacts would be anticipated. Any construction activities would have to comply with the City of Seattle's noise regulations or require a noise variance from the City. Where necessary, Sound Transit would monitor noise and vibration during construction to minimize related disturbances on residential and other sensitive areas and work with other adjacent projects to limit nighttime noise and vibration impacts.

7 NOISE AND VIBRATION MITIGATION MEASURES

For locations where Sound Transit has identified potential noise impacts, mitigation measures will be considered and reviewed using Resolution No. R2023-15, Sound Transit's light rail Link Noise and Vibration Policy (Sound Transit 2023). Under this policy, potential mitigation measures will be considered for all noise impacts where reasonable and feasible mitigation is available.

Sound Transit's noise mitigation policy is to mitigate impacts beginning with source treatment, followed by treatments in the noise path. If source and path treatments are not sufficient to mitigate the impact, Sound Transit will evaluate and implement sound insulation at affected properties where the existing building does not already achieve sufficient exterior-to-interior reduction of noise levels. Sound Transit practice is to mitigate both FTA moderate and severe impacts. Detailed tables of noise levels for each receiver location, before and after mitigation, are provided in Attachment N.3F.

Sections 7.1.1, Transit Noise Mitigation Approaches, and 7.1.2, Traffic Noise Mitigation Approaches, introduce the mitigation strategies normally used for light rail projects. Following this introduction, Section 7.1.3, Proposed Operational Noise Mitigation, presents the mitigation strategies and measures proposed for the West Seattle Link Extension. Mitigation for noise related to construction is discussed in Section 7.2.

Also consistent with Sound Transit's policy, where potential vibration impacts are identified, vibration mitigation measures will be considered. Vibration mitigation measures focus on reducing the source of vibration, with path and building treatment being considered as secondary measures. Section 7.3.1, Vibration Mitigation Approaches, introduces the vibration mitigation strategies normally used for light rail projects. The vibration mitigation measures and strategies proposed for the project are presented in Section 7.3.2, Proposed Operational Vibration Mitigation. Section 7.4 discusses construction vibration mitigation measures for surface construction and tunneling.

During final design, all impacts and potential mitigation measures will be reviewed for verification. If it is discovered that the mitigation could be achieved by less costly means, or if refined detailed analysis shows reduced or no impact, the mitigation measure may be downgraded or eliminated.

7.1 Operational Noise Mitigation

This section discusses mitigation for noise generated by the operation of the West Seattle Link Extension. Potential mitigation measures for construction noise are discussed in Section 7.2, Construction Noise Mitigation.

7.1.1 Transit Noise Mitigation Approaches

Several types of noise mitigation measures can be used to reduce noise levels and mitigate noise impacts. First, to minimize noise effects and the subsequent need for their mitigation, Sound Transit has incorporated several noise-reducing project design elements into the project. These include the noise-reducing effects from elevated structures and retained-cut segments where project-related design reduces noise from light rail operations through physical shielding. For areas where these types of design options are not available, other forms of mitigation are considered and are discussed in order of application in the following sections (e.g., source, path, or receiver).

7.1.1.1 Noise Source Mitigation

One of the most effective forms of noise mitigation is to reduce noise at the source. One form of source noise reduction is using light rail vehicles with low noise levels. Sound Transit has purchased state-of-the-art, lower-noise vehicles equipped with noise-reducing wheel skirts covering the wheel-rail interface. Several additional operational measures can also be used to reduce noise levels at the source. Table 4-1 lists operational and maintenance measures that Sound Transit performs on a regular basis and the benefits that these measures provide. Crossovers, special track work, and adjustments based on track type are provided in Table 7-1. Typical noise reductions for sound walls, elevated acoustical walls, and trench situations are also shown in Table 7-1. Source treatments that Sound Transit is currently using to minimize noise impacts include requiring wheel skirts, maintaining smooth tracks, performing vehicle maintenance and wheel truing, and conducting operator training.

Table 7-1. Light Rail Noise-shielding Adjustments

Track Type	Adjustment in Decibels
Acoustical sound walls on structures between 4 and 6 feet above the top of rail with some going as high as 8 feet. Walls on structures over 8 feet are not normally used because of wind loading and safety concerns.	Typical noise reduction of 6 to 15 dB or more, as predicted using FTA formulas and verified with measured data during normal operations along the existing light rail line in Tukwila.
Sound wall at-grade with an expected height of at least 6 feet above the grade of the guideway. An at-grade sound wall can go as high as 20 feet or more; however, for light rail only mitigation, the typical heights range from 4 to 8 feet.	Typical noise reduction of 4 to 12 dB or more, as predicted using FTA formulas and verified with measured data during normal operations along the Tukwila segment.

Research into methods of reducing wheel squeal noise, including using non-oil-based lubricants (such as water) and friction modifiers, has found such methods effectively reduce or eliminate wheel squeal. The lubricants can be applied by personnel working trackside or by an automated applicator. It is the general policy of Sound Transit to install lubricators on curves with a radius of 600 feet or less and prepare for lubrication on any curves with a radius of less than 1,250 feet near noise-sensitive properties. If wheel squeal is identified after system operation begins, it is possible to add lubricators. There are also some additional considerations that will be reviewed as related to installation and use of lubricants. For example, on some guideways with steeper grades, lubricants on the rails can make track maintenance more difficult and prevent the use of hi-rail vehicles. In some cases, the lubricator may need to be disabled from time to time to facilitate maintenance activities and wayside noise levels and noise from wheel squeal could increase during these brief periods. Once work is completed, the wayside lubricants would be reactivated.

When a light rail train travels over special trackwork for crossovers or turnouts, there is a loud clicking noise as the steel wheels go over the gap between the tracks. This can increase noise levels from the train by as much as 10 dBA compared with a smooth track with no gaps. Mitigation for noise impacts from special trackwork can include relocating the crossover or turnout away from noise-sensitive properties or using special frogs that include gap-closing mechanisms or moveable-point frogs.

With standard rigid frogs, noise and vibration occurs when the wheels pass over the gap in the rail, but a moveable-point frog eliminates the gap and one end of the frog moves in the direction of train travel. Other similar options for reducing noise from special trackwork include spring-rail or flange-bearing frogs. Flange-bearing frogs transfer the vehicle load from the wheel tread to the wheel flange and raise the light rail car up and over the gap, reducing noise and vibration levels. Each of these types of frogs produces noticeably lower noise levels than standard frogs.

Depending on the type of crossover and angle between the crossover and mainline track, special frogs can reduce noise levels between 4 and 8 dBA compared to a standard frog. The type of frogs used for the project would depend on the track type, crossover location, and proximity of noise-sensitive properties.

Relocation of special trackwork to more than 500 feet from noise-sensitive sites also could be used to eliminate the noise impact from the frogs.

7.1.1.2 Path Noise Mitigation

The next type of mitigation considered would be applied between the noise source and receiver. Typical noise path mitigation includes earth berms, sound walls, and buffer zones. Constructing barriers between the light rail tracks and the affected receivers would reduce noise levels by physically blocking the transmission of noise generated by light rail. Barriers can be constructed as walls or earth berms. Berms require more right-of-way than walls and are usually constructed with a 3-to-1 slope. Berms would not be feasible for the project because of topographical conditions and limited right-of-way. Therefore, walls would be used where appropriate.

Two types of sound walls are typically used for transit projects: For at-grade areas, the noise barrier type is a standard concrete wall, while on the elevated guideway, lightweight acoustical walls that place less load on the structure are used. Sound walls should be high enough to break the line of sight between the noise source and the receiver. The typical height for sound walls is 6 to 8 feet (or more) when at-grade and 4 to 6 feet when on elevated structures. Sound walls must also be long enough to prevent flanking of noise around the ends of the walls. Openings in sound walls for driveway connections or intersecting streets greatly reduce the effectiveness of these walls.

Buffer zones are undeveloped open spaces between the noise source and receiver. Buffer zones are created when an agency purchases land or development rights in addition to the normal right-of-way, so that future dwellings cannot be constructed close to the noise source. The West Seattle Link Extension corridor is an urban area that is heavily developed, so creating buffer zones is not a feasible form of noise mitigation because it would require substantially more project-related property acquisition and displacements.

7.1.1.3 Receiver Noise Mitigation

For situations where noise path mitigation would be either unfeasible or ineffective, Sound Transit would consider adding sound insulation to buildings. Sound insulation programs are developed to reduce the interior noise levels in sleeping and living quarters in residential land uses or in noise-sensitive areas such as schools and other institutional uses to within the guidelines set by the U.S. Department of Housing and Urban Development. Under these guidelines, interior noise levels for residential land uses should not exceed an Ldn of 45 dBA, and a form of fresh air exchange must be maintained. The air exchange can be achieved by opening a window or using a ventilation system. Sound insulation is normally only used on older dwellings with single-paned windows or in buildings with double-paned windows that are no longer effective because of leakage. Sound insulation would not reduce exterior noise levels.

7.1.2 Traffic Noise Mitigation Approaches

Potential traffic noise impacts could be mitigated either alone or in conjunction with the light rail mitigation.

In West Seattle, the displacement of residences along 32nd Avenue Southwest under Preferred Option DEL-6b and Alternative DEL-6a required an analysis for traffic noise impacts at residences with increased exposure to West Seattle Bridge traffic noise. The area was analyzed, and no traffic noise impacts were identified due to the steep hillside providing some noise shielding and preventing much of the traffic noise from propagating into the neighborhood. Therefore, no traffic noise mitigation was required.

7.1.3 Proposed Operational Noise Mitigation

For most identified noise impacts, sound walls were the selected method of reducing noise levels, consistent with Sound Transit's Link Noise Mitigation Policy (Sound Transit 2004). Sound walls would be effective at eliminating most predicted noise impacts in the West Seattle Link Extension. Details on the locations and heights for the new walls are provided by project and segment in the following sections. The sound walls presented here were evaluated using 100-foot-long panel segments and the actual wall segments would be much shorter in length, typically 12 to 14 feet long. In addition, during final design, the walls would be optimized further based on any revisions to the project design; therefore, the final wall lengths and heights may vary from those presented here, based on updated design elements and land uses along the corridor. Also, because detailed station design was not available for all stations, and because most station design includes noise-reducing elements, mitigation near some stations is quantified using an equivalent sound wall. In fact, for most stations, these design elements would be sufficient to mitigate noise from light rail operations.

Noise mitigation for the project includes sound walls along the elevated structures and along some at-grade retained-cut segments. Because of the height of some structures in the West Seattle area, not all noise impacts can be mitigated with sound walls. For those sites where sound walls would not be effective, building sound insulation will be examined. Maps showing the locations of sound walls are provided in Attachment N.3D.

7.1.3.1 SODO Segment

There are no FTA noise impacts in the SODO Segment of the West Seattle Link Extension and therefore, no noise mitigation is proposed.

7.1.3.2 Duwamish Segment

Sound walls are summarized by alternative in Tables 7-2 through 7-4. Project station numbering is provided in each of the tables as a reference for the wall locations. With the proposed mitigation, all impacts would be mitigated.

Under Preferred Alternative DUW-1a, Option DUW-1b, and Alternative DUW-2, a 300-foot-long, 4-foot-tall sound wall would be required along the west side of the elevated light rail structure for Seattle Fire Station 14, on 4th Avenue South. Two additional sound walls would also be needed under Preferred Alternative DUW-1a and Option DUW-1b along the Pigeon Point area, east and west of the retained-cut sections of the guideway.

Under Preferred Alternative DUW-1a when connecting to Alternative DEL-6a, additional noise impacts were identified due to the trackway being elevated along a slope in Pigeon Point. There may be an option to install noise walls along the top of the slope; however, due to service access and hillside support, the walls are not included in this analysis and those impacts would be reviewed for sound insulation. If this alternative is selected, additional mitigation analysis would be required.

Under Preferred Alternative DUW-1a, the following sound walls would be needed:

- One 300-foot-long, 4-foot-tall wall on the west side of the structure to provide mitigation to Fire Station 14
- A second, 700-foot-long wall ranging in height from 4 to 8 feet on the south side of the elevated structure to provide mitigation to the east side of the Pigeon Point area
- A third, 800-foot-long, 4- to 8 foot-tall wall on the south side of the structure to provide mitigation for the western slope of Pigeon Point

Table 7-2. Summary of Sound Walls for the Preferred South Crossing Alternative (DUW-1a)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	West	174+00	177+00	4 feet	300 feet
At-grade-level and elevated sound wall	East	253+00	260+00	4 to 8 feet	700 feet
Elevated sound wall	East	264+00	Continued in Delridge	4 to 6 feet	800 feet

The sound wall information presented in Table 7-2 would be for connections to Preferred Option DEL-6b and Alternative DEL-7. If connecting to other Delridge Segment alternatives, the sound walls would be similar but the lengths of the at-grade and elevated walls could increase by 100 feet, except for the connection to Alternative DEL-3 and Alternative DEL-4. Because the location of the alignment is farther from the Pigeon Point area, an additional 500 feet of wall would be required for the connection to Alternative DEL-3 and Alternative DEL-4 when compared to Preferred Alternative DUW-1a connecting to Preferred Option DEL-6b and Alternative DEL-7. Wall heights would vary by connection; however, the walls would be 4 to 6 feet, with some short sections of 100 to 200 feet where 8 foot walls may be required.

Table 7-3. Summary of Sound Walls for the South Crossing South Edge Crossing Alignment Option (DUW-1b)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	West	174+00	177+00	4 feet	300 feet
Elevated sound wall	East	253+00	262+00	4 to 8 feet	900 feet
Elevated sound wall	East	267+00	Continued in Delridge	4 feet	400 feet

The sound wall information presented in Table 7-3 would be for connections to Alternative DEL-1a, Option DEL-1b, Alternative DEL-2a, Option DEL-2b, Alternative DEL-3, and Alternative DEL-4. If connecting to Preferred Option DEL-6b, Alternative DEL-6a, or Alternative DEL-7, the sound wall length would be slightly shorter and the heights could be slightly different and vary by connection.

Table 7-4. Summary of Sound Walls for the North Crossing Alternative (DUW-2)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	West	174+00	177+00	4 feet	300 feet

Under Alternative DUW-2, the only sound wall required is for Fire Station 14, on 4th Avenue South.

7.1.3.3 Delridge Segment

Sound walls are summarized by alternative in Tables 7-5 through 7-14. Project station numbering is provided in each of the tables as a reference for the wall locations.

Under Preferred Option DEL-6b, the following sound walls would be needed:

- A 4- to 8-foot-tall sound wall would begin just south of Delridge Station along the east side of the guideway where it begins to curve toward to the west. The wall would continue through to the West Seattle Junction Segment (2,600 feet).
- A 4- to 6-foot-tall sound wall on the west side of the guideway would begin just east of the intersection of Southwest Andover Street and Southwest Avalon Way where the guideway turns south to travel west of 32nd Avenue Southwest. The 800-foot-long wall would end approximately 400 feet from the West Seattle Junction Segment.
- Noise mitigation would not be required at the Delridge Station as it would be further away from sensitive receivers east of Delridge Way Southwest.

The sound walls are sufficient to mitigate all potential noise impacts under Preferred Option DEL-6b. Table 7-5 summarizes the sound walls for Preferred Option DEL-6b.

Table 7-5. Summary of Sound Walls for the Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
At-grade-level and elevated sound wall	East	280+00	Continues in West Seattle Junction	4 to 8 feet	2,600 feet
At-grade-level and elevated sound wall	West	293+00	301+00	4 to 6 feet	800 feet

Under Alternative DEL-1a, the following sound walls would be needed:

- A sound wall from the Duwamish Segment would continue along the east side of the elevated guideway to the curve on to Southwest Genesee Street, ending approximately 400 feet west of 26th Avenue Southwest. A shorter length would be needed when connecting to Alternative DUW-2 in the Duwamish Segment.
- Sound walls on the west side of the elevated structure along Southwest Delridge Way and along Southwest Genesee Street, continuing to the West Seattle Junction Segment.

Sound walls on the east side of the elevated guideway on Southwest Genesee Street east of Southwest Avalon Way, continuing to the West Seattle Junction Segment. Noise mitigation no less effective than a 4-foot sound wall would also be integral on both sides of the Delridge Station. Mitigation no less effective than a 4-foot wall means that the station design would include elements that would provide the same reduction as a wall that was at least 4 feet above the top or rail. Due to different installation techniques of the rails that are unknown at this time, the noise mitigation in some areas, for example stations, are specified using this terminology. All sound walls would have a height of 4 feet to 6 feet and with the proposed mitigation, all impacts under Alternative DEL-1a would be mitigated. The new walls also would provide noise mitigation for the FTA Category 1 Secret Studio Records/Studio 1208. Table 7-6 summarizes the sound walls for Alternative DEL-1a.

Noise mitigation under Option DEL-1b would be the same as described for Alternative DEL-1a and would also be effective at mitigation of all noise impacts.

Table 7-6. Summary of Sound Walls for the Dakota Street Station Alternative (DEL-1a)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall [a]	East	Continued from Duwamish Segment	295+00	4 feet	2,500 feet
Elevated sound wall	West	282+00	Continues in West Seattle Junction	4 to 6 feet	2,800 feet
Elevated sound wall	East	306+00	Continues in West Seattle Junction	4 feet	400 feet

[a] Sound wall would be shorter in length when connecting to Alternative DUW-2.

Noise mitigation under Option DEL-1b would be the nearly the same as described for Alternative DEL-1a with one change in sound wall height from 4 feet to 6 feet at the southwest corner of Southwest Avalon Way and Southwest Genesee Street before dropping back down to 4 feet at the Delridge and West Seattle Junction segments border. Table 7-7 summarizes the sound walls for Option DEL-1b.

Table 7-7. Summary of Sound Walls for the Dakota Street Station North Alignment Option (DEL-1b)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	East	Continued from Duwamish Segment	294+00	4 feet	2,400 feet
Elevated sound wall	West	282+00	Continues in West Seattle Junction	4 to 6 feet	2,800 feet
Elevated sound wall	East	306+00	Continues in West Seattle Junction	4 to 6 feet	400 feet

Under Alternative DEL-2a, the location and lengths of sound walls for the west side of the guideway are the same as described under Alternative DEL-1a; however, because of the lower track alignment, many of the sound walls along Delridge Way Southwest and Southwest Genesee Street would be taller, ranging from 4 to 8 feet tall. Sound walls along the east side of the guideway would also be the same as with Alternative DEL-1a with slightly taller walls of 4 to 6 feet, continuing from the Duwamish Segment to Southwest Genesee Street, ending approximately 400 feet west of 26th Avenue Southwest. Noise mitigation no less effective than a 4-foot sound wall would also be integral on both sides of the Delridge Station. The new walls would also provide noise mitigation for the FTA Category 1 Secret Studio Records/Studio 1208. Table 7-7 summarizes the sound walls for Alternative DEL-2a.

Even with sound walls of up to 8 feet, the following seven units would not be mitigated:

- Four units at the multi-family building The Edge Apartments at 3014 Southwest Genesee Street
- Three units at 3120 Avalon Way

All noise impacts identified would be to the exterior of the units. The Edge Apartments was constructed in 1958, prior to many current building requirements, and has no outdoor uses, and therefore may be a candidate for sound insulation such as improved windows and fresh air exchange systems. The final building, 3120 Avalon Way, is a newer building (constructed in 2002) and therefore would have double-pane windows. The impacts that could not be mitigated are on the upper floor of this six-floor building. If this alternative is selected, additional testing

may be performed at each of these buildings. The purpose of the testing would be to determine the interior noise levels from transit operations and to verify compliance that they meet the Department of Housing and Urban Development requirements or provide recommended acoustical improvements. However, with the sound walls and building insulation as needed, the interior noise levels would be within Department of Housing and Urban Development requirements, and all noise impacts would be mitigated. Table 7-8 summarizes the sound walls for Alternative DEL-2a.

Table 7-8. Summary of Sound Walls for the Dakota Street Station Lower Height Alternative (DEL-2a)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	East	Continued from Duwamish Segment	293+00	4 feet	2,30 feet
Elevated sound wall	West	282+00	Tunnel Portal	4 to 8 feet	2,500 feet

Option DEL-2b would be to the north along Southwest Genesee Street and would remove several of the buildings near Southwest Avalon Way. The sound walls would be similar to Alternative DEL-2a, with wall heights ranging from 4 feet to 8 feet. Noise mitigation no less effective than a 4-foot sound wall would also be integral on both sides of the Delridge Station. The new walls also provide noise mitigation for the FTA Category 1 Secret Studio Records/Studio 1208. Under this alternative, there are approximately four top-floor (sixth-floor) units at the Youngstown Flats that could not be mitigated with walls. The impacts at the Youngstown Flats under Option DEL-2b are slightly different than Alternative DEL-2a because the elevation of the track and station location are slightly different. This slight change in the track elevation and station location increases the number of impacts remaining, even with an 8-foot sound wall. If this alternative is selected, additional testing may be performed at those units where noise mitigation was not predicted to resolve impacts. The purpose of the testing would be to determine the interior noise levels from transit operations and verify that they meet the Department of Housing and Urban Development requirements for residences. With the sound walls and building insulation as needed, the interior noise levels would be within Department of Housing and Urban Development requirements. Table 7-9 summarizes the sound walls for Option DEL-2b.

Table 7-9. Summary of Sound Walls for the Dakota Street Station Lower Height North Alignment Option (DEL-2b)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	East	Continued from Duwamish Segment	294+00	4 feet	2,400 feet
Elevated sound wall	West	282+00	Tunnel Portal	4 to 8 feet	2,500 feet

Under Alternative DEL-3, the following sound walls would be needed:

- Sound walls on the east side of the guideway continuing from the Duwamish Segment to Southwest Genesee Street and ending approximately 100 feet west of 26th Avenue Southwest
- Sound walls on the west side of the guideway along Delridge Way Southwest south of Southwest Andover Street and ending along Southwest Genesee Street approximately 500 feet east of Delridge Way Southwest

- Sound walls on the west side of the structure from the north end of the Delridge Station to the connection in the West Seattle Junction Segment
- Sound walls on the east side of the elevated guideway along Southwest Genesee Street east of Southwest Avalon Way, continuing to the West Seattle Junction Segment

Noise mitigation no less effective than a 4-foot sound wall would also be integral along the east side of the Delridge Station. The new walls also provide noise mitigation for the FTA Category 1 Secret Studio Records/Studio 1208. With the new sound walls, all noise impacts are mitigated. Table 7-10 summarizes the sound walls for Alternative DEL-3.

Table 7-10. Summary of Sound Walls for the Delridge Way Station Alternative (DEL-3)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	East	Continued from Duwamish Segment	291+00	4 to 6 feet	2,000 feet
Elevated sound wall	East	294+00	298+00	4 feet	400 feet
Elevated sound wall	East	306+00	309+00	4 feet	300 feet
Elevated sound wall	West	Delridge Station	Continues in West Settle Junction	4 to 6 feet	3,100 feet

Under Alternative DEL-4, the following sound walls would be needed:

- Sound walls on the east side of the guideway continuing from the Duwamish Segment to Southwest Genesee Street and ending approximately 100 feet west of 26th Avenue Southwest
- Sound walls on the west side of the structure from the north end of the Delridge Station to the connection in the West Seattle Junction Segment

Noise mitigation under Alternative DEL-4 would range from 4- to 8-foot-tall walls to account for the lower track elevations. Even with the walls, four units on the upper floor at the multi-family building at 3101 Southwest Avalon Way are predicted to meet or exceed the FTA criteria. Therefore, the upper-floor units in this multi-family building may be candidates for sound insulation. If this alternative is selected, additional testing may be performed. The purpose of the testing would be to determine the interior noise levels from transit operations and to verify that they meet the Department of Housing and Urban Development requirements for residences or to provide recommended structural improvements. However, with the sound walls and building insulation as needed, the interior noise levels would be within Department of Housing and Urban Development requirements, and all noise impacts would be mitigated. Table 7-11 summarizes the sound walls for Alternative DEL-4.

Table 7-11. Summary of Sound Walls for the Delridge Station Lower Height Alternative (DEL-4)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
At-grade-level and elevated sound wall	East	Continued from Duwamish Segment	297+00	4 to 6 feet	2,600 feet
At-grade-level and elevated sound wall	West	280+00	Tunnel Portal	4 to 8 feet	3,000 feet

For Alternative DEL-5, the following sound walls would be needed:

- The continuation of the 4-foot-tall sound wall on the east side of the guideway in the Duwamish Segment for an additional 300 feet, providing noise mitigation for residences along Southwest Delridge Way and 23rd Avenue Southwest
- A second, 4-foot-tall, east-side sound wall continuing from just east of 26th Avenue Southwest to just east of 28th Avenue, providing noise mitigation for the Youngstown Flats multi-family building

A third, 4-foot-tall, east-side sound wall with a parallel, 4- to 8-foot-tall, sound wall on the west side from just west of 28th Avenue Southwest to the connection to the West Seattle Junction Segment. There are up to 15 multi-family residences in a nine-floor building at 3050 Southwest Avalon Way that are well above the guideway and could not be mitigated with sound walls; however, this building was constructed in 2018, has no external uses at the upper floors, and given current construction requirements for double-pane windows and wall insulation, interior noise levels at these units are likely within Department of Housing and Urban Development requirements. If this alternative is selected, additional testing may be performed at those units where noise mitigation was not predicted to resolve impacts. The purpose of the testing would be to determine the interior noise levels from transit operations and to verify that they meet the Department of Housing and Urban Development requirements for residences or to provide recommended structural improvements. With the sound walls and building insulation as needed, the interior noise levels would be within Department of Housing and Urban Development requirements. Table 7-12 summarizes the sound walls for Alternative DEL-5.

Table 7-12. Summary of Sound Walls for the Andover Street Station Alternative (DEL-5)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	East	273+00	276+00	4 feet	300
Elevated sound wall	East	279+00	282+00	4 feet	300 feet
Elevated sound wall	East	287+00	Continues in West Seattle Junction	4 feet	1,900 feet
Elevated sound wall	West	292+00	Continues in West Seattle Junction	4 to 8 feet	1,400

Noise mitigation for Alternative DEL-6a begins at the connection to the Duwamish Segment, with a continued sound wall just east of the Delridge Station. Alternative DEL-6a would also have a sound wall along the east side of the guideway for mitigation at the Youngstown Flats multi-family building. Sound walls would also be required along the east side of the guideway from just east of 28th Avenue Southwest, continuing to the tunnel portal to the West Seattle Junction Segment. Finally, a 6- to 8-foot-tall sound wall would be needed along the west side of the guideway for approximately 800 feet starting at Southwest Avalon Way. The sound walls are sufficient to mitigate all potential noise impacts under Alternative DEL-6a. Table 7-13 summarizes the sound walls for Alternative DEL-6a.

Table 7-13. Summary of Sound Walls for the Andover Street Station Lower Height Alternative (DEL-6a)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	East	Continued from Duwamish Segment	274+00	4 feet	300 feet
Elevated sound wall	East	278+00	282+00	4 feet	400 feet
At-grade-level and elevated sound wall	East	292+00	Continues in West Seattle Junction	4 to 8 feet	1,400 feet
At-grade-level and elevated sound wall	West	292+00	300+00	4 to 8 feet	800 feet

Noise mitigation for Alternative DEL-7 begins south of the Delridge Station with 4- to 6-foot-tall sound walls along the east side of the guideway and continues to the tunnel portal. Noise mitigation would not be required at the Delridge Station as it would be further away from sensitive receivers east of Delridge Way Southwest. A 4-foot-tall sound wall would also be required along the westside of the guideway from the intersection of Southwest Avalon Way and Southwest Andover Street till just before the tunnel portal entrance.

Even with the walls, two units at the multi-family building at 3000 Southwest Avalon Way and two single-family residences at 4031 and 4035 32nd Avenue Southwest are predicted to meet or exceed the FTA criteria. Therefore, these residences may be candidates for sound insulation. If this alternative is selected, additional testing may be performed. The purpose of the testing would be to determine the interior noise levels from transit operations and to verify that they meet the Department of Housing and Urban Development requirements for residences or to provide recommended structural improvements. However, with the sound walls and building insulation as needed, the interior noise levels would be within Department of Housing and Urban Development requirements and all noise impacts would be mitigated. Table 7-14 summarizes the sound walls for Alternative DEL-7.

Table 7-14. Summary of Sound Walls for the Andover Street Station Lower Height No Avalon Station Tunnel Connection (DEL-7)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	East	280+00	Tunnel Portal	4 to 6 feet	2,100 feet
Elevated sound wall	East	294+00	298+00	4 feet	400 feet

7.1.3.4 West Seattle Junction Segment

Sound walls are summarized by alternative in Tables 7-15 through 7-19. Project station numbering is provided in each of the tables as a reference for the wall locations.

Under Preferred Option WSJ-5b, the sound wall would continue from the Delridge Segment on the east side of the trackway. The 6- to 10-foot-tall sound walls just prior to Avalon Station would mitigate noise coming from the retained cut. Table 7-15 summarizes the new wall.

Table 7-15. Summary of Sound Walls for the Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
At-grade-level	East	Continued from Delridge Segment	309+00	6 to 10 feet	400 feet

Alternative WSJ-1 would continue sound walls on both sides of the guideway from the Delridge Segment, including at the Avalon Station. Sound walls up to 8 feet tall would be required for the upper floors of the multi-family units south of the station area. The walls on the east and south side of the guideway would continue to the west side of 35th Avenue Southwest, where land use changes to commercial and no mitigation is needed. On the west and north side of the guideway, the walls end at 35th Avenue Southwest and start again near 37th Avenue Southwest, continuing at 4 to 8 feet tall to the end of the alignment near Southwest Hudson Street. Sound walls would also be needed along the east and south of the guideway near Southwest Oregon Street, 40th Avenue Southwest and from Southwest Alaska Street to the end of the guideway.

Because of the severe noise impacts and building elevations, sound walls would not be sufficient to fully mitigate the noise impacts at the following locations:

- A single-family residence on 40th Avenue Southwest
- Upper-floor units at the multi-family building at 4100 Southwest Alaska Street
- Upper-floor units at the multi-family building at 5000 California Avenue Southwest

The noise impact at the single-family residence on 40th Avenue Southwest is due in part to the double crossover and requires special trackwork mitigation in addition to the sound wall. The remaining sites would be considered for sound insulation as needed, but the buildings at 4100 Southwest Alaska Street are newer construction and would be equipped with double-pane windows. The multi-family building at 5000 California Avenue Southwest was constructed in 1984 and had a major remodel performed in 2018 that may have included installation of improved windows. If this alternative is selected, additional testing may be performed at each of these buildings. The purpose of the testing would be to determine the interior noise levels from transit operations and to verify that they meet the Department of Housing and Urban Development requirements for residences or to provide recommended structural improvements. With the sound walls, special trackwork, and building insulation as needed, the interior noise levels would be within Department of Housing and Urban Development requirements, and all noise impacts would be mitigated. Table 7-16 summarizes the sound walls for Alternative WSJ-1.

Table 7-16. Summary of Sound Walls for the Elevated 41st/42nd Avenue Station Alternative (WSJ-1)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	East	Continued from Delridge Segment	317+00	4 to 8 feet	800 feet
Elevated sound wall	West	Continued from Delridge Segment	312+00	4 feet	300
Elevated sound wall	West	319+00	Project Terminus	4 to 8 feet	3,600 feet
Elevated sound wall	East	329+00	333+00	4 feet	400 feet
Elevated sound wall	East	337+00	340+00	4 feet	300 feet
Elevated sound wall	East	343+00	Project Terminus	4 feet	1,200 feet

Alternative WSJ-2 would also continue the sound walls from the Delridge Segment on both sides of the alignment and include the same noise mitigation at the station. Sound walls would also be needed on the west side of the structure (north) near 36th Avenue Southwest to the Alaska Junction Station. Sound walls on the east side of the guideway (south) would resume south of Southwest Oregon Street to and including the Alaska Junction Station with mitigation equivalent to a 6-foot wall. North of the Alaska Junction Station, 4-foot sound walls would continue to mitigate sound from light rail operations on the trail tracks. Sound insulation would be considered for upper floors of a multi-family building on Fauntleroy Way Southwest (4800 and 4830) near the project terminus. The building was constructed in the 1980s and would be considered for sound insulation and tested to verify the interior noise levels from transit operations meet the Department of Housing and Urban Development requirements for residences if this alternative is selected. With the set of noise mitigation measures (i.e., walls and sound insulation), all noise impacts would be mitigated. Table 7-17 summarizes the walls proposed for Alternative WSJ-2.

Table 7-17. Summary of Sound Walls for the Elevated Fauntleroy Way Station Alternative (WSJ-2)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall [a]	East	Continued from Delridge Segment	317+00	4 to 6 feet	800 feet
Elevated sound wall	West	Continued from Delridge Segment	338+00	4 feet	2,900 feet
Elevated sound wall	East	331+00	Project Terminus	4 to 8 feet	1,300 feet
Elevated sound wall	West	342+00	Project Terminus	4 to 6 feet	200 feet

[a] Sound wall would be shorter in length when connecting to Option DEL-1b.

Under Alternative WSJ-3a and Option WSJ-3b, the alignment is entirely in a tunnel in the West Seattle Junction Segment and no noise impacts were identified and no mitigation is required.

Alternative WSJ-4 would continue the sound walls from the Delridge Station on both sides of the alignment and include noise mitigation at the Avalon Station. The 4- to 6-foot-tall walls would mitigate noise from the station. An additional 4-foot sound wall would be required along the west and north side of the guideway from near 36th Avenue Southwest to just prior to the tunnel portal. All impacts would be mitigated. Table 7-18 summarizes the new sound wall.

Table 7-18. Summary of Sound Walls for the Short Tunnel 41st Avenue Station (WSJ-4)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
Elevated sound wall	West	Continued from Delridge	316+00	4 feet	700 feet
Elevated sound wall	East	Continued from Delridge	316+00	4 to 6 feet	700 feet
Elevated sound wall	West	319+00	327+00	4 feet	800 feet

Alternative WSJ-5a would continue the sound walls from the Delridge Segment on the east side of the trackway. The 4- to 8-foot-tall sound walls just prior to Avalon Station would mitigate noise coming from the retained-cut segment. Table 7-19 summarizes the new wall.

Table 7-19. Summary of Sound Walls for the Medium Tunnel 41st Station Alternative (WSJ-5a)

Mitigation	Side of Track	Start Station	End Station	Wall Height	Wall Length
At-grade-level	East	Continued from Delridge Segment	309+00	4 to 8 feet	400 feet

Under Alternative WSJ-6, the alignment is entirely in a tunnel in the West Seattle Junction Segment and no noise impacts were identified. Therefore, no mitigation is required.

7.2 Construction Noise Mitigation

Construction activities will be required to comply with codified sound limits. Nighttime construction would require a noise variance from the City of Seattle. Noise mitigation would likely be required for construction activities to comply with Seattle Municipal Code or variance sound level limits. The contractor will develop a Noise Control Plan prior to construction. The Noise Control Plan will detail the construction equipment and methods that will be used throughout the project, predicted sound levels from various construction phases, noise monitoring and reporting requirements, and the types of noise mitigation that will be used to satisfy project sound level limits. These noise mitigation measures may include the following, as appropriate:

- Schedule construction activities to occur during daytime hours, or if nighttime construction is unavoidable, schedule the loudest construction activities for daytime hours.
- Install construction noise barriers between the construction site and noise-sensitive properties at tunnel portals, or other construction areas where nighttime construction or long periods of construction are anticipated.
- Use backup warning devices that are the least intrusive broadband type on all equipment or use backup observers as permitted by law.
- Use low-noise emission equipment.
- Use bed lining such as soil, gravel, or rubber in all haul truck beds.
- Monitor and maintain equipment to meet noise limits.
- Use lined or covered storage bins, conveyors, and chutes with sound-deadening material.
- Use radios for all long-range communication onsite; no yelling should be permitted except in case of an emergency.
- Limit use of public address systems.
- Remove any material or debris spilled on pavement by hand sweeping and avoid scraping type equipment or activity will be used to clean pavement surfaces.
- Limit engine idling to not more than two minutes when vehicles or equipment are not directly engaged in work activity.
- Locate stationary equipment away from noise-sensitive properties to the extent possible.
- Where practical, minimize the use of generators or use generators in sound-rated enclosures.
- Operate equipment to minimize banging, clattering, buzzing, and other annoying types of noises.

- To the extent feasible, configure the construction site in a manner that keeps noisier equipment and activities as far as practicable from noise-sensitive locations and nearby buildings.
- Provide enclosures for stationary equipment and barriers around particularly noisy areas of the site.
- Phase start-up of equipment and avoid simultaneous high-noise activities.
- Fit equipment with high-grade engine exhaust silencers and/or engine shrouds.
- Additional coordination of the construction activities and scheduling may also be necessary with sensitive land uses along the corridor, including recording studios, performance arts centers, and other highly sensitive land uses.

7.3 Operational Vibration Mitigation

7.3.1 Vibration Mitigation Approaches

Several different approaches have been used by rail transit systems to reduce groundborne vibration and groundborne noise. The most common vibration mitigation measures used on light rail systems consist of placing a resilient layer between the track and the soil. Some standard approaches for vibration mitigation measures with direct-fixation track are as follows:

- High-resilience fasteners: Direct-fixation track fasteners are used to attach the rail to the concrete track slab in a tunnel or on an elevated structure. High-resilience fasteners include a soft, high-resilience element (nominal vertical static stiffness of 60,000 pounds force inch and a dynamic to static ratio of 1.4:1) to provide greater vibration isolation than standard rail fasteners in the vertical direction.
- Floating slabs: Floating slab consists of a concrete slab supported by elastomer springs on a concrete foundation. The elastomer springs could be a continuous mat or individual springs. The frequency range at which a floating slab is effective depends on the thickness of the slab and the stiffness of the springs. Floating slabs are very effective at reducing vibration levels, particularly at low frequencies. However, they are also very expensive.
- Low-impact special trackwork: The impacts of vehicle wheels over rail gaps at special trackwork locations such as turnouts and switches can increase vibration levels by up to 10 dB. If special trackwork cannot be located away from vibration-sensitive receivers, another approach is to use low-impact frogs. Spring-rail and moveable-point frogs allow the flangeway gap to remain closed in the main traffic direction for revenue service trains and can almost completely reduce the vibration increase caused by special trackwork. Monoblock frogs are milled out of a single block of steel and their tolerances can be tighter than a traditional frog, which reduces the vibration increase. Flange-bearing frogs include a ramp to support the flange of the wheel to minimize banging. Well-designed monoblock and flange-bearing frogs can reduce the vibration level increase by about half compared to a standard frog.
- Alternative approaches: There are alternative vibration mitigation approaches that may be applied under specific circumstances. Examples include increasing the thickness of the concrete under the track, specifying straighter rails, and building the track on top of pile foundation systems when the track would traverse very soft sections of soil.

The typical vibration mitigation measure for ballast-and-tie track is ballast mat; however, there would be no vibration exceedances in ballast-and-tie track areas.

7.3.2 Proposed Operational Vibration Mitigation

Vibration mitigation is proposed for all sensitive receivers where there would be impacts. Locations of vibration impacts are shown in the maps in Attachment N.3E. The key points of mitigation are as follows:

- High-resilience fasteners are proposed for most vibration and groundborne noise exceedances for direct-fixation track for tunnels or elevated structure.
- Low-impact frogs are proposed at locations where exceedances are predicted as a result of amplification from special trackwork. Moveable-point frogs and monoblock frogs are examples of low-impact frogs that provide different levels of vibration reduction. Moveable-point frogs are proposed as a low-impact frog where the projected levels exceed the limit by more than 5 dB. Monoblock frogs are proposed as a low-impact frog where the projected levels exceed the limit by less than 5 dB. Low-impact frogs with similar performance could be used in place of the proposed frog.

During final design, the vibration analysis will be refined before finalizing mitigation measures. Increasing the distance between the track and the closest sensitive receiver by removing buildings may eliminate the need for track-based mitigation. Site-specific vibration measurements at locations where vibration exceedances are predicted could also be used to refine the predicted vibration levels and mitigation recommendations.

The following sections describe the mitigation recommendations for each segment of the West Seattle Link Extension. High-resilience fasteners are used to connect the rail to the track slab and are softer than traditional fasteners, which allows them to absorb some of the vibration that is transmitted from the rail into the ground. The lifespan is similar to traditional fasteners, and no special maintenance is required. A frog is a component of special trackwork where there is a gap in the rail to allow one rail to cross another. The impacts of vehicle wheels over rail gaps can cause high levels of noise and vibration. Low-impact frogs are designed to reduce the impact forces at the gap, and as a result produce lower noise and vibration levels.

7.3.2.1 SODO Segment

There would be no vibration impacts for any alternatives in the SODO Segment; therefore, no vibration mitigation measures are proposed.

7.3.2.2 Duwamish Segment

There would be no vibration impacts for Option DUW-1b and Alternative DUW-2. Impacts for Preferred Alternative DUW-1a are projected in two different special trackwork areas: at Fire Station 14 in east Duwamish near the turnout at the entrance to the Maintenance Facility and at a single-family residence near the crossover east of Delridge Way Southwest near the West Seattle Bridge on-ramp. Proposed mitigation at both locations would be a low-impact frog, such as a monoblock frog. At both locations, the predicted vibration level exceeds the impact threshold by less than 1 decibel. Additional analysis or refinement of the prediction model during final design may show that the predicted levels are below the impact threshold without mitigation.

Table 7-20 summarizes the proposed mitigation measures for the Preferred Alternative DUW-1a vibration impacts.

Table 7-20. Summary of Vibration and Groundborne Noise Impacts and Proposed Mitigation for the Preferred South Crossing Alternative (DUW-1a)

Alternatives and Design Options	Sound Transit Right-of-way I.D.	Number of Impacts	Proposed Mitigation	Start Station	End Station	Approximate Length of Mitigation (feet)
DUW-1a	WS10046	1	Reassessment (exceeds by less than 1 dB)/ Low-impact frog, monoblock	SB-W 174+00	SB-W 174+00	Not applicable
DUW-1a (*when connecting to DEL-6b only*)	WS5541	1	Reassessment (exceeds by less than 1 dB)/ Low-impact frog, monoblock	SB-W 266+00	SB-W 266+00	Not applicable

7.3.2.3 Delridge Segment

There would be no vibration impacts for Option DEL-1b, Alternative DEL-2a, Option DEL-2b, and Alternative DEL-4. Impacts and proposed mitigation for the other alternatives would be as follows:

- Preferred Option DEL-6b would have a vibration impact at one single-family residence located close to the elevated structure near the intersection of Southwest Andover Street and Southwest Avalon Way. The proposed mitigation is high-resilience fasteners.
- Alternative DEL-1a would have a vibration impact at a multi-family residential building near the curve at the intersection of Southwest Genesee Street and Southwest Avalon Way. The proposed mitigation is high-resilience fasteners.
- Alternative DEL-3 would have a vibration impact at one multi-family building near the curve at the intersection of Southwest Genesee Street and Southwest Avalon Way. The proposed mitigation measure is high-resilience fasteners.
- Alternative DEL-5 would have vibration impacts at the multi-family building at the intersection of Southwest Dakota Street and 30th Avenue Southwest. The proposed mitigation measure is high-resilience fasteners.
- For Alternative DEL-6a, there would be vibration impacts at the buildings near the intersection of Yancy Street and 32nd Avenue Southwest and at a building near the retained-cut portion of the alignment on 32nd Avenue Southwest. The proposed mitigation measure is high-resilience fasteners.
- For Alternative DEL-7, there would be groundborne noise impacts at the residences where the tunnel gets shallower as it approaches the tunnel portal. The proposed mitigation is high-resilience fasteners.

Table 7-21 through Table 7-26 summarize the proposed mitigation measures for the Delridge Segment Build Alternatives with vibration impacts.

7.3.2.4 West Seattle Junction Segment

There would be no vibration impacts for Alternative WSJ-2. Impacts and proposed mitigation for the remaining West Seattle Junction Segment Build Alternatives would be as follows:

- For Preferred Option WSJ-5b, there would be groundborne noise impacts where the tunnel is shallowest near the tunnel portal and along the curve. The proposed mitigation at both of these locations is high-resilience fasteners. There would also be groundborne noise impact near the special trackwork south of the Alaska Junction Station. The proposed mitigation is a low-impact frog, such as a moveable-point frog. Site-specific vibration propagation data may show that a monoblock or flange-bearing frog provides sufficient mitigation.
- For Alternative WSJ-1, there would be groundborne noise impacts at parcels close to a crossover. The proposed mitigation is a low-impact frog, such as a monoblock frog.
- For Alternative WSJ-3a, there would be groundborne noise impacts at residences east of the Avalon Station where the tunnel would be shallower and at residences near the curve between Southwest Oregon Street and Southwest Alaska Street. The proposed mitigation measure in this area is high-resilience fasteners. Site-specific vibration propagation data at residences near Avalon Station may show that mitigation is not necessary, because most of the projected levels exceed the criteria by less than 2 dB, which is less than the safety factor applied in the prediction model. There would also be a groundborne noise impact near the special trackwork south of the Alaska Junction Station. The proposed mitigation is a low-

impact frog, such as a moveable-point frog. Site-specific vibration propagation data may show that a monoblock or flange-bearing frog provides sufficient mitigation.

- The proposed mitigation for Option WSJ-3b is similar to the recommendations for Alternative WSJ-3a. Groundborne noise impacts would occur at residences east of Avalon Station where the tunnel would be shallower. The proposed mitigation measure in this area is high-resilience fasteners. There would also be groundborne noise impacts at residences on 42nd Avenue Southwest near the crossover south of the Alaska Junction Station. The proposed mitigation is a low-impact frog, such as a moveable-point frog. The projected groundborne noise levels at two of the buildings exceed the threshold for impact by more than 10 dB, which is the expected reduction of the low-impact frog. Site-specific vibration propagation testing is proposed to verify additional mitigation measures, such as high-resilience fasteners, are not necessary.
- For Alternative WSJ-4, there would also be groundborne noise impacts near the crossover south of the Alaska Junction Station and at the receivers north of the same station where the tunnel depth is shallower. The proposed mitigation for the special trackwork is a low-impact frog, such as a moveable-point frog. The proposed mitigation for the other groundborne noise impacts is high-resilience fasteners.
- For Alternative WSJ-5a, there would be groundborne noise impacts near the crossover south of the Alaska Junction Station and at the receivers between the Alaska Junction Station and Avalon Station where the tunnel would be shallower compared to some of the other alternatives. The proposed mitigation for the special trackwork is a low-impact frog, such as a moveable-point frog or spring-rail frog. The proposed mitigation for the other impacts is high-resilience fasteners.
- For Alternative WSJ-6, there would be groundborne noise impacts along the curve where the tunnel is shallower. The proposed mitigation is high-resilience fasteners. There would also be groundborne noise impact near the special trackwork south of the Alaska Junction Station. The proposed mitigation is a low-impact frog, such as a moveable-point frog.

Tables 7-27 through 7-33 summarize, by alternative, the proposed mitigation measures for the West Seattle Junction Segment.

Table 7-27. Summary of Vibration and Groundborne Noise Impacts and Proposed Mitigation for the Preferred Medium Tunnel 41st Avenue Station West Entrance Station Option (WSJ-5b)

Alternatives and Design Options	Sound Transit Right-of-way I.D.	Number of Impacts	Proposed Mitigation	Start Station	End Station	Approximate Length of Mitigation (feet)

7.4 Construction Vibration Mitigation

The primary means of mitigating vibration from construction activities is to require the contractor to prepare a detailed Construction Vibration Control Plan. The contractor will prepare the plan in conjunction with the contractor's specific equipment and methods of construction. Key elements of a plan are as follows:

- Contractor's specific equipment types.
- Schedule and methods of construction.
- Identification of all Category 1 and special-use buildings near construction sites.
- Methods for projecting construction vibration levels.
- Construction vibration limits.
- Specific vibration-control measures where predicted levels exceed the limits.
- Methods for responding to community complaints.

7.4.1 Potential Surface Construction Vibration Mitigation

Construction should be carried out in compliance with Sound Transit specifications and all applicable local regulations. Specific construction vibration mitigation measures should be developed during the design phase when more detailed construction means and methods information is available. The following mitigation measures should be applied as needed to minimize construction vibration impacts:

- **Pre-construction survey:** Prior to the start of construction, a survey of buildings including inspection and photographs of building foundations should be completed near construction areas. All potentially fragile structures within 200 feet should be included.
- **Construction timing:** Nighttime construction in residential neighborhoods should be avoided and businesses coordinated with to avoid interfering with sensitive daytime activities. Additional coordination of the construction activities and scheduling may also be necessary with sensitive land uses along the corridor, including recording studios, performance arts centers, and other highly sensitive land uses. Local ordinances should be followed unless variances are obtained.
- **Equipment location:** Stationary construction equipment should be as far as possible from vibration-sensitive sites.
- **Continuous vibration monitoring:** Monitoring can be implemented at particularly sensitive receivers, such as Category 1 or special-use buildings with low vibration limits.
- **Alternative construction methods:** Alternative construction methods should be used, where practical, to minimize the use of impact and vibratory equipment (e.g., pile drivers and compactors).

Predicted vibration levels from impact pile-driving exceed the impact threshold for potential risk of minor cosmetic building damage at structures within 100 feet. If pile-driving is planned within 100 feet of structures, alternative methods of pile installation or vibration monitoring would be considered. Examples of alternative construction methods for impact pile-driving are drilled shaft foundations or shallow spread footings. Pre-construction surveys would be conducted to document the existing conditions of buildings, and the contractor would be responsible for repairing damage due to the project. During final design, all impacts and proposed mitigation measures would be reviewed for verification.

The contractor, when selected, will prepare and implement a detailed Construction Vibration Control Plan that provides more detail on the construction vibration mitigation measures.

7.4.2 Potential Tunneling Vibration Mitigation

As discussed in Section 6.4.1, the predicted vibration levels generated by the tunnel boring machine are less than the impact thresholds. However, there may be exceedances of the groundborne noise threshold at Category 2 (residential) sensitive receivers from the tunnel boring machine cutterhead. The following presents options for reducing vibration from tunneling activities.

Tunnel boring machine cutterhead vibration is inherent to the operation of the machine, and the range of vibration experienced at sensitive receivers is largely dependent on the soil conditions at the cutterhead. Unfortunately, no mitigation measures exist to reduce tunnel boring machine cutterhead vibration levels, but vibration from the cutterhead would be temporary as the tunnel boring machine advances past the sensitive land uses (roughly 6 days for each bore as discussed in Section 6.4.1). Vibration monitoring and coordination with Category 1 and special-use buildings while the tunnel boring machine is passing can be used to minimize interruption of operations.

The vibration caused by the thrust jack retraction is not predicted to create damage or annoyance impacts and no mitigation is required. If complaints were to occur, they could be addressed by modifying the thrust jacks so that the cylinders are retracted slowly and eliminate the hard stop.

Operations of the supply train are not predicted to exceed the damage or annoyance impact threshold; however, the following options could mitigate vibration levels from the supply train if needed:

- Reducing the operating speed. Reducing the speed of the train from 12 miles per hour to 6 miles per hour provides a reduction in 1/3-octave band vibration levels from 2 to 7 VdB.
- Smoothing the running surface.
- Reducing the size of gaps between rail sections.
- Adding a rubber pad between the ties and the tunnel invert can also help reduce vibration levels from the supply train.
- Using rubber tire supply train vehicles, which generally reduce vibration to levels below the existing ambient, particularly at frequencies above 10 hertz.

A comparison of the vibration attenuation provided by these supply train mitigation methods is provided on Figure 7-1. The attenuation provided by the rubber-tire-vehicle above 10 hertz is estimated assuming vibration levels of 35 VdB, because the measured data above 10 hertz were below the ambient level. Figure 7-2 shows the maximum vibration levels measured from the rubber tire vehicles that were used during boring of the University Link Extension tunnel. No data are available above 10 hertz, suggesting that the measured levels were at or below the existing ambient vibration at higher frequencies. As shown on Figure 7-2, vibration levels from rubber tire vehicles are well below the Category 2 threshold and are below the V.C.-E threshold (very demanding vibration criterion for extremely vibration-sensitive equipment) at most frequencies. Only Category 1 receivers that are highly sensitive to low-frequency vibration have the potential to be impacted by the operation of rubber tire vehicles during tunneling. Finally, in some locations, additional coordination of the construction activities and scheduling may be necessary to minimize impacts at sensitive land uses along the corridor.

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-2. Summary of Noise Analysis – Preferred South Crossing (DUW-1a) when Connecting to the Delridge Way Station Alternative (DEL-3)

Receiver Area	King County Parcel Number	Sound Transit Right-of-Way ID	Track Station Number	Receiver Street Address	Receiver Land Use Type[a]	Number of Units Represented	Existing Noise Level (Ldn/Leq, dBA)[b]	Distance from Track to Building (feet)[c]	Noise from Light Rail Operations (Ldn/Leq, dBA)[d]	Noise Metric Type (Ldn for residences, Leq for others)	FTA Moderate Impact Criteria	FTA Severe Impact Criteria	Number of Moderate Impacts	Number of Severe Impacts	Sound Wall Side of Track Way and Height	Special Trackwork Recommended	Recommended for Sound Insulation	Light Rail Noise with Mitigation

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-3. Summary of Noise Analysis – Preferred South Crossing Alternative (DUW-1a) when Connecting to the Delridge Way Station Lower Height Alternative (DEL-4)

Receiver Area	King County Parcel Number	Sound Transit Right-of-Way ID	Track Station Number	Receiver Street Address	Receiver Land Use Type[a]	Number of Units Represented	Existing Noise Level (Ldn/Leq, dBA)[b]	Distance from Track to Building (feet)[c]	Noise from Light Rail Operations (Ldn/Leq, dBA)[d]	Noise Metric Type (Ldn for residences, Leq for others)	FTA Moderate Impact Criteria	FTA Severe Impact Criteria	Number of Moderate Impacts	Number of Severe Impacts	Sound Wall Side of Track Way and Height	Special Trackwork Recommended	Recommended for Sound Insulation	Light Rail Noise with Mitigation

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-4. Preferred South Crossing (DUW-1a) when Connecting to the Andover Street Station Alternative (DEL-5)

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-5. Preferred South Crossing (DUW-1a) when Connecting to the Andover Street Station (Lower Height) Alternative (DEL-6a)

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-6. Summary of Noise Analysis – South Edge Crossing Alignment Option (DUW-1b)

Receiver Area	King County Parcel Number	Sound Transit Right-of-Way ID	Track Station Number	Receiver Street Address	Receiver Land Use Type[a]	Number of Units Represented	Existing Noise Level (Ldn/Leq, dBA)[b]	Distance from Track to Building (feet)[c]	Noise from Light Rail Operations (Ldn/Leq, dBA)[d]	Noise Metric Type (Ldn for residences, Leq for others)	FTA Moderate Impact Criteria	FTA Severe Impact Criteria	Number of Moderate Impacts	Number of Severe Impacts	Sound Wall Side of Track Way and Height	Special Trackwork Recommended	Recommended for Sound Insulation	Light Rail Noise with Mitigation

Table Notes

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = Day-Night Sound Level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = Equivalent Sound Level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

ROW = Right of Way

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions, depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-9. Summary of Noise Analysis – Dakota Street Station Alternative (DEL-1a) when Connecting to the North Crossing Alternative (DUW-2)

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-10. Summary of Noise Analysis – Dakota Street Station North Alignment Option (DEL-1b)

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-11. Summary of Noise Analysis – Dakota Street Station Lower Height Alternative (DEL-2a)

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-12. Summary of Noise Analysis – Dakota Street Station Lower Height North Alignment Option (DEL-2b)

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-13. Summary of Noise Analysis – Delridge Way Station Alternative (DEL-3)

Receiver Area	King County Parcel Number	Sound Transit Right-of-Way ID	Track Station Number	Receiver Street Address	Receiver Land Use Type[a]	Number of Units Represented	Existing Noise Level (Ldn/Leq, dBA)[b]	Distance from Track to Building (feet)[c]	Noise from Light Rail Operations (Ldn/Leq, dBA)[d]	Noise Metric Type (Ldn for residences, Leq for others)	FTA Moderate Impact Criteria	FTA Severe Impact Criteria	Number of Moderate Impacts	Number of Severe Impacts	Sound Wall Side of Track Way and Height	Special Trackwork Recommended	Recommended for Sound Insulation	Light Rail Noise with Mitigation
Duwamish Area: West Side of 21st Avenue Southwest along Southwest Charlestown Street	2848700407	WS5515	271	3816 22nd Avenue Southwest	MF	1	62	345	60	Ldn	59	65	1	0	East Side at 4 feet	Yes	No	53
Duwamish Area: West Side of 21st Avenue Southwest along Southwest Charlestown Street	2848700425	WS5512	271	3824 22nd Avenue Southwest	SF	1	62	389	59	Ldn	59	65	1	0	East Side at 4 feet	Yes	No	53
Duwamish Area: West Side of 21st Avenue Southwest along Southwest Charlestown Street	2848700435	WS5511	271	3830 22nd Avenue Southwest	SF	1	62	399	59	Ldn	59	65	1	0	East Side at 4 feet	Yes	No	53
Duwamish Area: West Side of 22nd Avenue and north of Southwest Andover Street	2848700345	WS5495	271	3813 22nd Avenue Southwest	MF	2	69	191	66	Ldn	64	70	2	0	East Side at 4 feet	Yes	No	55
Duwamish Area: West Side of 22nd Avenue and north of Southwest Andover Street	2848700335	WS5494	271	3817 22nd Avenue Southwest	MF	2	69	214	65	Ldn	64	70	2	0	East Side at 4 feet	Yes	No	55

Receiver Area	King County Parcel Number	Sound Transit Right-of-Way ID	Track Station Number	Receiver Street Address	Receiver Land Use Type[a]	Number of Units Represented	Existing Noise Level (Ldn/Leq, dBA)[b]	Distance from Track to Building (feet)[c]	Noise from Light Rail Operations (Ldn/Leq, dBA)[d]	Noise Metric Type (Ldn for residences, Leq for others)	FTA Moderate Impact Criteria	FTA Severe Impact Criteria	Number of Moderate Impacts	Number of Severe Impacts	Sound Wall Side of Track Way and Height	Special Trackwork Recommended	Recommended for Sound Insulation	Light Rail Noise with Mitigation

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-14. Summary of Noise Analysis – Delridge Way Station Lower Height Alternative (DEL-4)

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-16. Summary of Noise Analysis – Andover Street Station Lower Height Alternative (DEL-6a)

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-17. Summary of Noise Analysis – Preferred Andover Street Station Lower Height South Alignment Option (DEL-6b)

Receiver Area	King County Parcel Number	Sound Transit Right-of-Way ID	Track Station Number	Receiver Street Address	Receiver Land Use Type[a]	Number of Units Represented	Existing Noise Level (Ldn/Leq, dBA)[b]	Distance from Track to Building (feet)[c]	Noise from Light Rail Operations (Ldn/Leq, dBA)[d]	Noise Metric Type (Ldn for residences, Leq for others)	FTA Moderate Impact Criteria	FTA Severe Impact Criteria	Number of Moderate Impacts	Number of Severe Impacts	Sound Wall Side of Track Way and Height	Special Trackwork Recommended	Recommended for Sound Insulation	Light Rail Noise with Mitigation
Duwamish Area: West Side of 22nd Avenue and north of Southwest Andover Street	2848700175	WS5482	272	3824 23rd Avenue Southwest	MF	2	68	317	57	Ldn	63	69	0	0	None	Yes	No	57

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-18. Summary of Noise Analysis – Andover Street Station Lower Height No Avalon Tunnel Connection (DEL-7)

Table Notes

Note: If a property/receiver is not listed, it is either outside of the study area or it would be displaced by this alternative.

dBA = A-weighted decibels

FTA = Federal Transit Administration

Ldn = day-night sound level. Primarily for buildings with nighttime noise sensitivity, including residences, hotels, hospitals, and fire stations with sleeping areas.

Leq = equivalent sound level. Primarily for daytime use buildings, including schools, libraries, and day care centers.

[a] Land use categories are based on existing ambient levels and the FTA Transit Noise and Vibration Impact Assessment Manual categories. CH = Church, MF = Multi-Family Residence, PK = Park, REC = Recording Studio, SC = School, SF = Single-Family Residence, U = Undeveloped.

[b] The existing Leq and/or the Ldn before light rail construction and operations.

[c] Measured in feet from the closest point of the building to the light rail track. For larger buildings there can be multiple analysis positions depending on land use type.

[d] The predicted noise levels from the operation of the light rail system, including bells at stations and trackwork. This is the modeled project noise based on all the factors (such as track and frequency), which is then compared to FTA criteria to determine whether there would be an impact. If there were an impact, proposed mitigation and resulting project noise level after mitigation would be provided.

Table N.3F-19. Summary of Noise Analysis – Elevated 41st/42nd Avenue Station Alternative (WSJ-1)
